UN-GGIM

UN-GGIM: Four critical tasks

- Evolving <u>a shared vision</u> for the future in management of geospatial information nationally and globally;
- Evolving <u>an inclusive platform</u> for improving, sharing and disseminating national and global geospatial data;
- Evolving <u>a global 'Statement of Ethics'</u> and supporting code of conduct to enhance public trust;
- Evolving <u>a mutually beneficial relationship</u> between the Government and the non-Government entities;

Evolving a shared vision

 Evolving <u>a shared vision</u> for the future in management of geospatial information nationally and globally;

Visioning paper: Why?

United Nations Initiative on Global Geospatial Information Management

Background

• Agreed at the first meeting of the Committee of Experts on UN-GGIM that it would be useful to document the direction of travel for the geospatial world over the next 5 to 10 years

 Views sought from Member States, a number of experts and visionaries across a wide range of aspects of the geospatial community – from data collection experts, academics and major users of geospatial information, through to leading figures from the private sector and the Volunteer Geographic Information (VGI) movement

United Nations Initiative on Global Geospatial Information Management

Timetable

- Request for short papers sent out December 2011
- Contributions received by experts from a wide range of fields by February 2012
- Forum to further discuss emerging trends, Amsterdam 24 April
- Draft paper presented to 2nd session of UN-GGIM Committee of Experts, New York, August 2012 for consideration and discussion
- Final paper presented to Second High-Level Forum on UN-GGIM, Doha, Qatar, February 2013

Five broad themes identified

- Trends in technology and the future direction of data creation, maintenance and management
- Legal and policy developments
- Skills requirements and training mechanisms
- The role of the private sector and non-governmental sectors
- The future role of governments in data provision and management

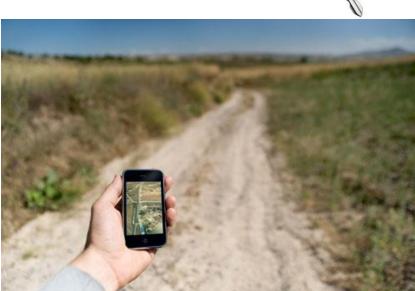

United Nations Initiative on Global Geospatial Information Management

- Everything will be, in some sense, a geospatial beacon, referencing to or generating location information.
- Location information as "*Analytical superfood*" that can and will, if used effectively and appropriately, improve people's lives across the globe.

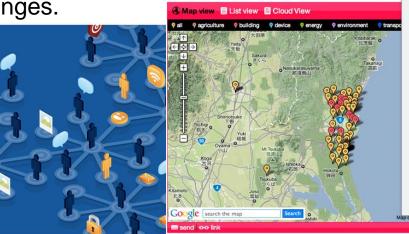

N-GGIM

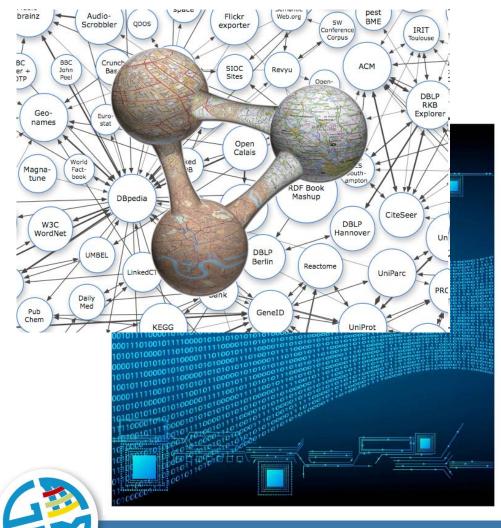

- Growth in the amount of data (approximately 2.5 quintillion bytes created per day) brings with it an ever-growing requirement to be able to find the *right* information at the *right* time.
- The demand for real-time information and real-time modelling available through social media and other web uses, seems certain to increase over the coming years and presents real challenges.

JN-GGIM

United Nations Initiative on Global Geospatial Information Management

N-GGIN

- Given the amount of data already generated and the fact that this amount will continue to grow, the importance of linking data together, particularly by location, is likely to grow.
- A hyper-connected environmentestimates suggest over 50 billion things connected by 2020.
- Real geospatial management challenges to feed the increasing demand to exploit this information
 - in real-time.

- Massive shift in how geospatial information managed, hosted, served and how it is consumed.
- Use of the cloud will become the norm, enabling the desired information accessible to anyone, anywhere, anytime, available on the device of your choice.

Toolbox

Print/export

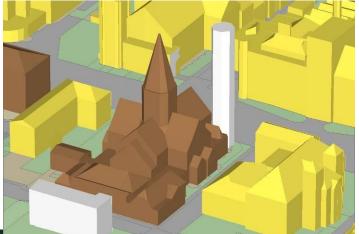

Languages

- Value of open source will grow as more users adopt and feedback improvements.
- Three trends likely to drive adoption:
 - Afrikaans 1 where resources are scarce or provides best expertese;
 - 1. ability to modify and share easily, and build common user communities;
 - 2. future geospatial leaders exposed at early stage to the use of open source and so already culturally attuned.

- The trend of moving from 2D mapping through to 3D and on to 4D visualisations is technology-driven and will accelerate.
- Users will expect much more complex and realistic models, to enable effective planning and management and to optimise resources.

UN-GGIM

- Unmanned Aerial Vehicles (UAVs) are likely to be increasingly used. An additional method of data capture on its own, and also to complement existing methods of aerial and satellite remote sensing.
- The ease-of-use, speed of capture, and ability to access difficult areas means they are of particular use in emergency response situations or where real-time information is of particular value to those on the ground.

N-GGIM

- Quality of aerial and satellite imagery will continue to increase.
- However, with existing availability of high resolution in many areas of the globe already, focus is likely to be on speed of acquisition and dissemination rather than on the quality.
- Indoor positioning is an emerging area of interest

N-GGIM

- Launch of new and next generation GNSS will enable faster data collection, with higher accuracy and greater integrity.
- Improved satellite technologies are starting to challenge the way vertical reference systems are defined.
- Interoperability and unification of geospatial information datasets across the globe will become increasingly important.

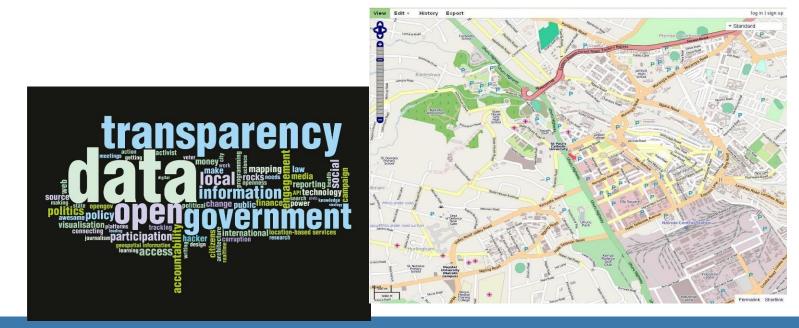

United Nations Initiative on Global Geospatial Information Management

J.

UN-GGIM

- Access to government generated geospatial information free at the point of use is likely to continue – but availability will be determined by the business models of the countries.
- One of the greatest policy change will be the drive to improve quality of core geospatial information, while securing funding to develop and maintain it.
- Maintenance of data costs money! What are the funding models that mean that data can be maintained and released as open data?

United Nations Initiative on Global Geospatial Information Management

JN-GGIN

- Traditional funding models may require radical change.
- Role of NMCAs will move towards demonstrating value and securing funding.
- Reductions in central government funding will necessitate more active collaboration with the private sector.

Tweet <2

A Berlin court has ruled that Google Street View is legal. But that doesn't mean the lawsuits will end, legal scholars say.

A Berlin court has ruled that Google Street View is, in fact, legal in Germany.

Last Tuesday, the Berlin State Supreme Court (Kammergericht) announced its decision in a court case from late last year, in which a warnan had sued Google, fearing that photos of her, her

he front of her house would be posted on Google

nd would thus violate her property and privacy

Canada slaps Google for Street View Wi-Fi intercepts

Canada's privacy commissioner says, however, that the matter is resolved if Google deletes data and agrees to improve privacy training.

by Declan McCullagh | October 19, 2010 1 42 PM PD7

Jennifer Stoddart, Canada's privacy commissioner, said she would consider the investigation closed and the matter resolved as long as Google revises its internal procedures to improve "the privacy training it provides all its employees" and deletes or segregates any data relating to Canadian citzens.

In e-mail to CNET a Google spokesman said the company is working with the privacy commissioner. "As vie have said tefore, we are profoundly sony for having missilenty collected paylead data from unencrytited interverts. As soon as we realized what have happend, we stopped collecting all W-Fr data from our Street View cars and immediately informed the authorities."

Stockart's report sheds a bit more light on what led to the erroneous collection of about 12 Bu-ray discs' worth of Wr-Fi transmissions worldwide. She said that her investigation revealed that an unnamed Goople engineer failed to follow company procedures by not sending design

N-GGIN

Hostile, If there is a perfect word that describes the response of European countries and parts of the United States about Google Street View, then this is the perfect one. Presently, there are over 30 nations that permitted the service's entrée in their land-and while Europe remains frigid about Google Street View, Israel sees the

good part and approved its operations with certain limitations.

- Individual's right to privacy, consumer protection and marketing laws need to evolve to enable each citizen to enjoy appropriate protections.
- Increasing demand for global frameworks that need to enable consistent, trans-border legal protections for individuals.
- Getting the best from volunteer geospatial community and government – a clear goal over the next five years.

United Nations Initiative on Global Geospatial Information Management

Data without Boundaries

- Where does liability lie if the trend in litigation and seeking legal redress for data issues grows?
- Technology develops without boundaries; whereas legal and policy frameworks, confined by national boundaries, are not developing in a consistent way.
- Development of consistent and transparent legal and policy frameworks – in areas such as privacy, national security, liability and intellectual property – are required.

UN-GGIM

SP

United Nations Initiative on Global Geospatial Information Management

- Premium for highly skilled data modellers with a range of competencies and ability to understand complex and time based data must be a priority.
- Global networked communities.

N-GGIN

- Research and development into new methods of cartography – particularly to facilitate display on different devices e.g. mobile, 3D TV
- More collaboration between NMCAs and the design and creative industries, to harness visualisation skills in a way which enables geospatial information to be presented in the most appropriate means to inform decision makers.

- Policy and decision makers, to the very highest levels of governments and NGOs will need education in the value of using geospatial information as a building block of base infrastructure of each nation
- Wider range of professional, academic and in-business approaches, in collaboration with leading NMCAs, to develop a global skills base.

JN-GGIN

ggim.un.org

- Investment in Research and Development (R&D) will continue to be vital.
- Areas of particular interest should include:
- 1. More effective and automatic processing of sensor data
- 2. Development of location based applications and integration of high volumes of unstructured data
- Investing in early stage prototyping, testing and evaluating in emerging areas means opportunities can be realised at the earliest opportunity – and is more widely understood within a range of organisations.

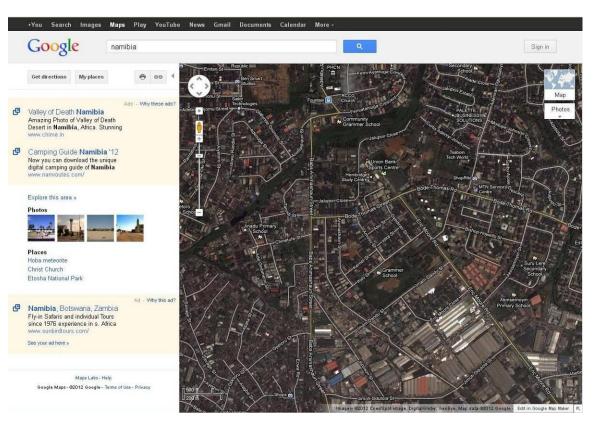

United Nations Initiative on Global Geospatial Information Management

Global Geospatial Information Management

- The private sector has made geospatial information accessible to the masses.
- The increasing demand for trans-border information have, in many parts, been met by the private sector.

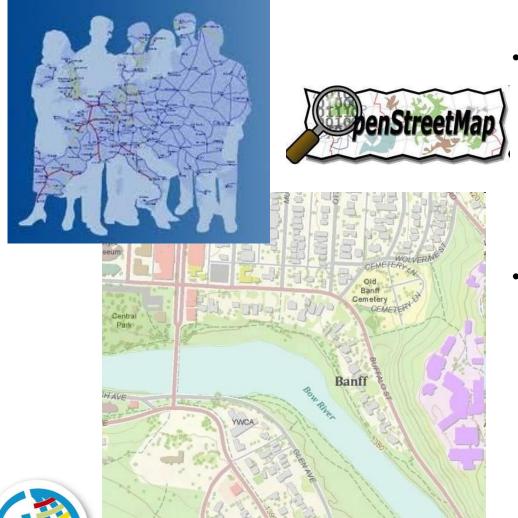

- Government will likely remain the largest customers and commissioning agents for private sector geospatial information.
- Private sector will face challenges for example, creating and finding opportunities outside the government and NGO markets, and funding models will increasingly need to be driven by either value add-ons, or through other means.
- Government release of open data, means the private sector may have to focus elsewhere in the value chain, and will likely lead to greater public-private partnerships.

N-GGIN

JN-GGIM

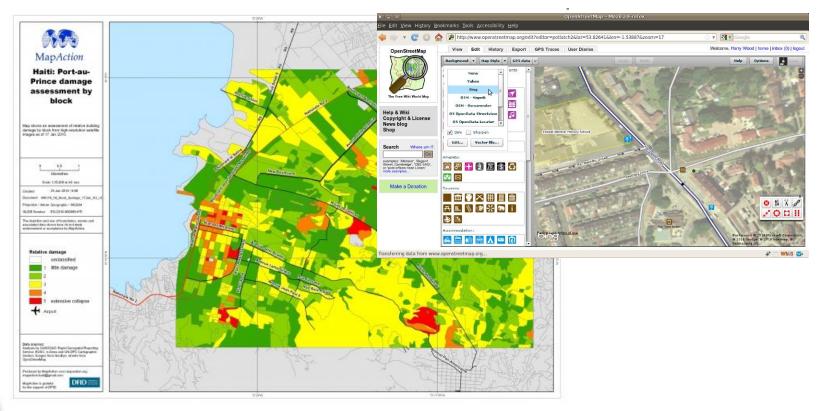

- Volunteer Geographic Information (VGI) may act as a valuable mechanism to encourage public participation and engage and empower citizens.
- User led VGI and crowd sourced methods, in active partnerships with the NMCAs, may lead the way in how these methods are integrated most effectively.

 VGI has the potential to enable a user's view of their environment, which if utilised by policy and decision-makers, will allow for potentially more effectively targeted interventions and more tailored public services.

 VGI bring many benefits, and its use is likely to continue growing – it will be in addition to, NOT replacement of, a wide range of quality-assured, maintained geospatial information from other sources.

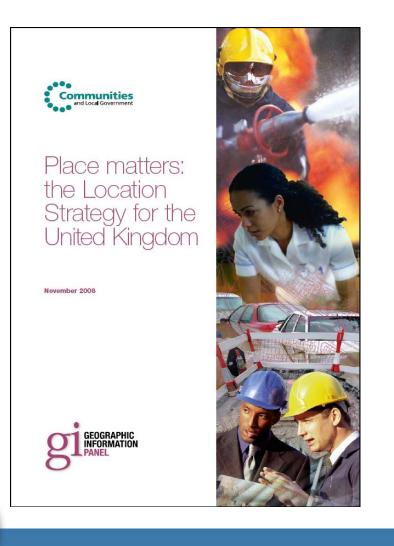

United Nations Initiative on Global Geospatial Information Management

UN-GGIM

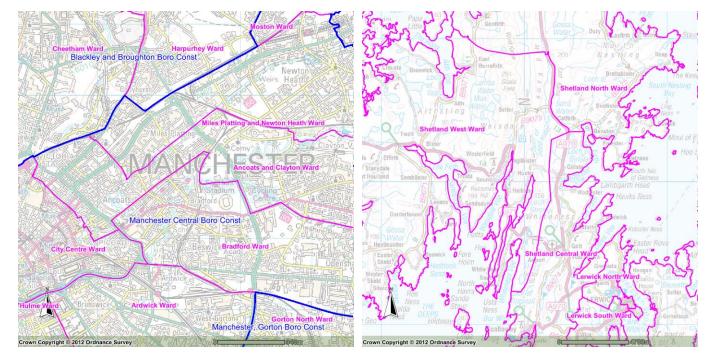

United Nations Initiative on Global Geospatial Information Management

JN-GGIM

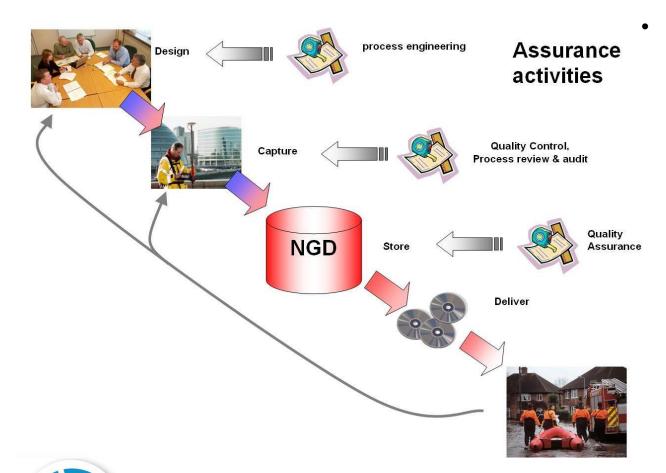

- Unlikely to wholly rely on data from the private sector and VGI community.
- Unique position to consider geospatial information requirements for society as a whole.
- Government has a key role to facilitate collaboration between all 'actors' and support all sources of information.

- Bridging the gap between authoritative and crowd sourced data.
- Moving away from competition and more towards collaboration or "coopetition"

United Nations Initiative on Global Geospatial Information Management

IN-GGIM

IN-GGIM

Increase in the number of sources of geospatial information will challenge NMCAs, forcing a reconsideration of the traditional role played by government in collection of and provision of geospatial data.

United Nations Initiative on Global Geospatial Information Management

 End-users should be able to consume government-assured spatial data with the level of trust in quality as they do when they get water from the tap – they are going to get what they expect.

UN-GGIM Committee of Experts

• Evolving <u>a shared vision</u> for the future in management of geospatial information nationally and globally – we want **your** views.
