

Some practices of Geospatial coding and referencing statistics in Finland and in Europe

Marja Tammilehto-Luode
UN Expert Group on the Integration of Statistical and
Geospatial Information
30.10. – 1.11.2013

Some practices of Geospatial coding and referencing statistics in Finland and in Europe

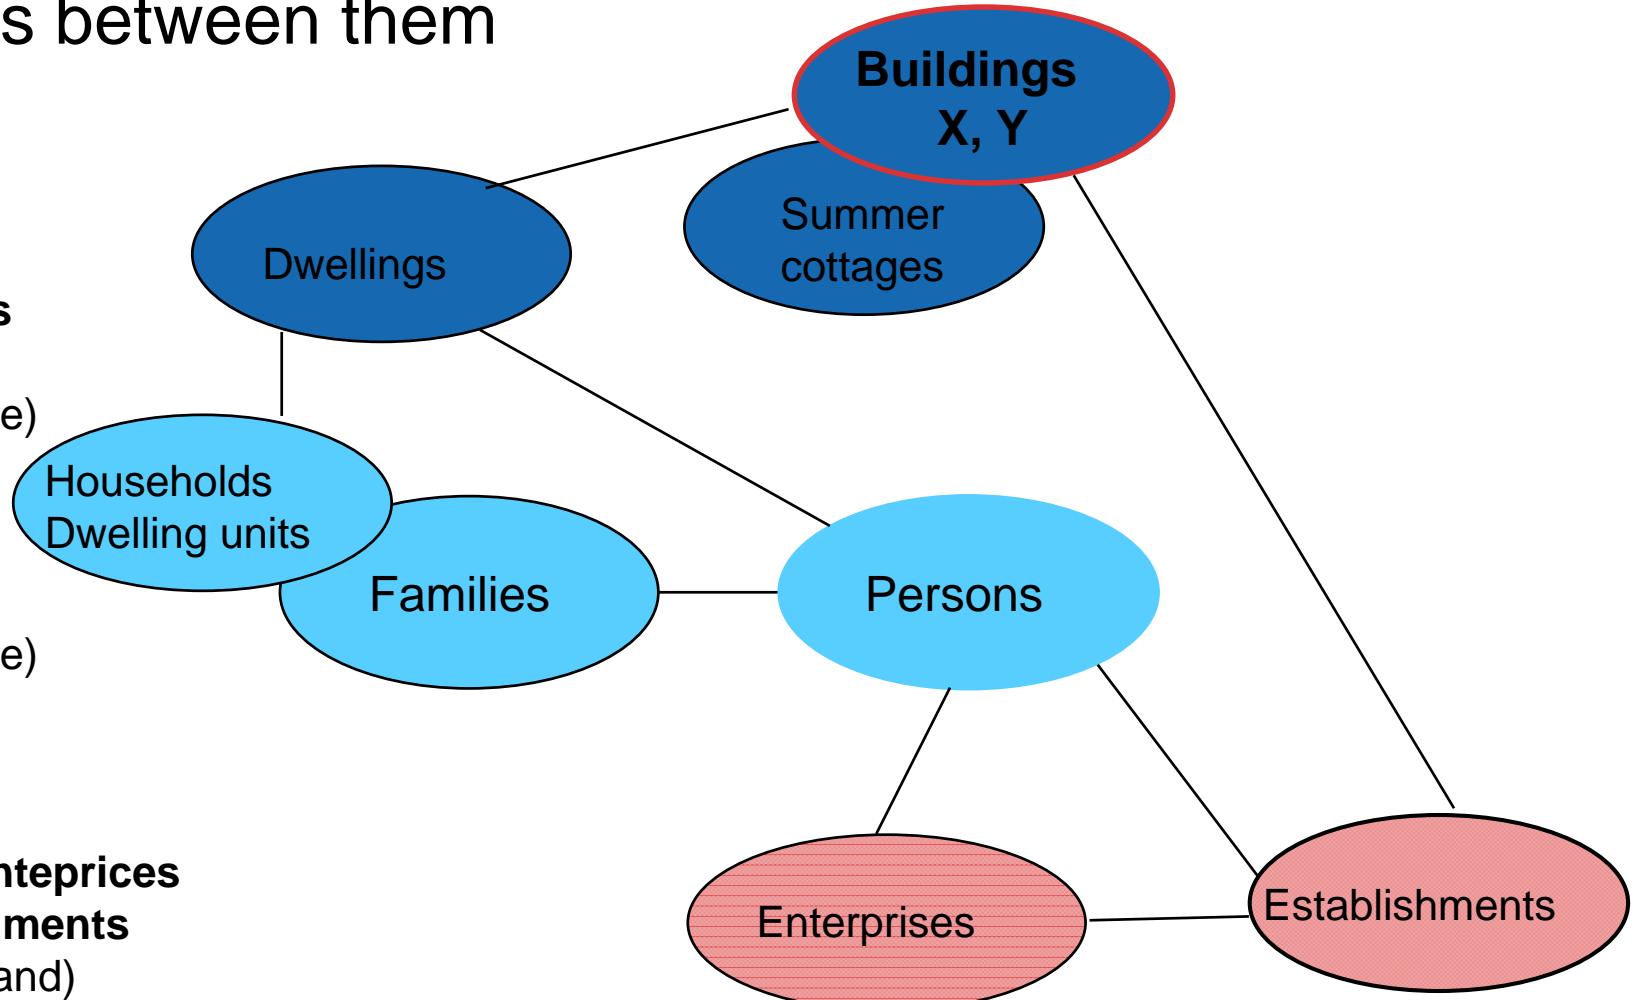

- Capabilities for geocoding
- Data warehouse + Geodatabase
- Statistical grids
- Point-based geospatial statistical framework
- National and European cooperation and standards
- Challenges for the future

Units belonging to the register based statistics and links between them

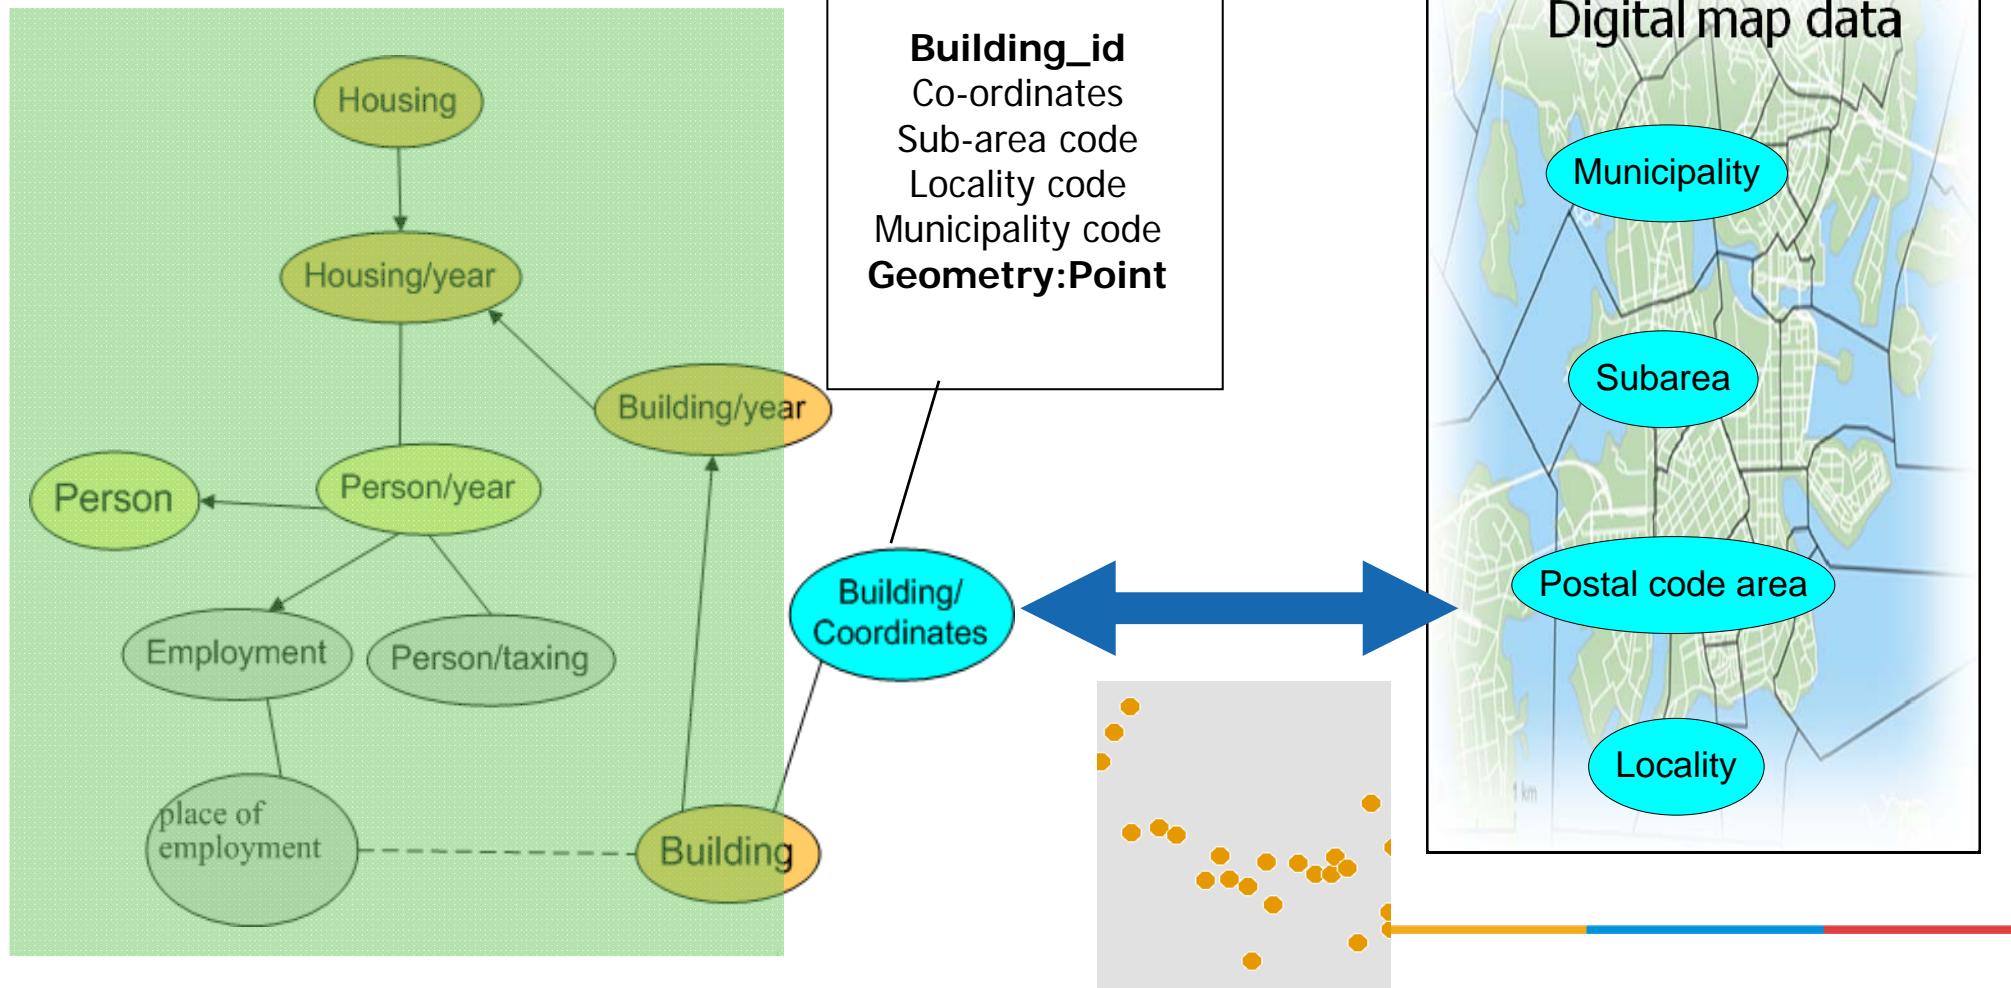

**Register of
Buildings
and Dwellings**
(Population
Registre Centre)

**Register of
Persons**
(Population
Registre Centre)

**Register of Enterprises
and Establishments**
(Statistics Finland)

Links of statistical entities, building coordinates and map data in the population statistics database

Inspire data

You can find the descriptions (Metadata) for Inspire data under [Geodata search](#) in Paikkatietoikkuna. You can view the data in the [Map window](#) in Paikkatietoikkuna or download them to your application using the address links given in the data descriptions or for some datasets also with the Atom feed. The same descriptions and links can also be found in the table below.

The Inspire datasets offered by Statistics Finland are as follows:

Data descriptions in the spatial data directory	Interface services
Statistics grid 1 km x 1 km	Atom feed (RSS)
Municipality-based statistical areas	WMS WFS
Population by statistical area	WMS WFS
Educational institutions	WMS WFS
Production and industrial facilities	WMS WFS
Population grid data 1 km x 1 km	WMS WFS Atom feed (RSS)

Classifications

- Regional classifications
- Social classifications
- Economic classifications
- Other classifications

International classifications

- Contact information

Welcome to the Internet pages of Classification Services

Statistics Finland's Classification Services maintain and publish national classification recommendations. Several of them are based on international standards confirmed by EU directives. Use of classification recommendations improves the comparability of statistical information produced at different times and in different areas.

Classifications consist of headings, or names of groups, of codes given to them, i.e. numerical or alphabetical codes, and of descriptions of groups, i.e. definitions. Classification refers to dividing individual items of information present in statistical data according to certain features into different groups where each unit belongs to only one group. In the classification the groups are named and codes are issued to them.

Classifications can be divided into four groups:

- **Regional classifications** (e.g. division into regions and major regions)
- **Social classifications** (e.g. occupation and education)
- **Economic classifications** (e.g. industry and sector)
- **Other classifications** (e.g. land use and buildings)

Spatial statistics production environment

- Database; SQL Server database
- Data compilation; with e.g. SAS or SQL
- Spatiality; ESRI ArcSDE

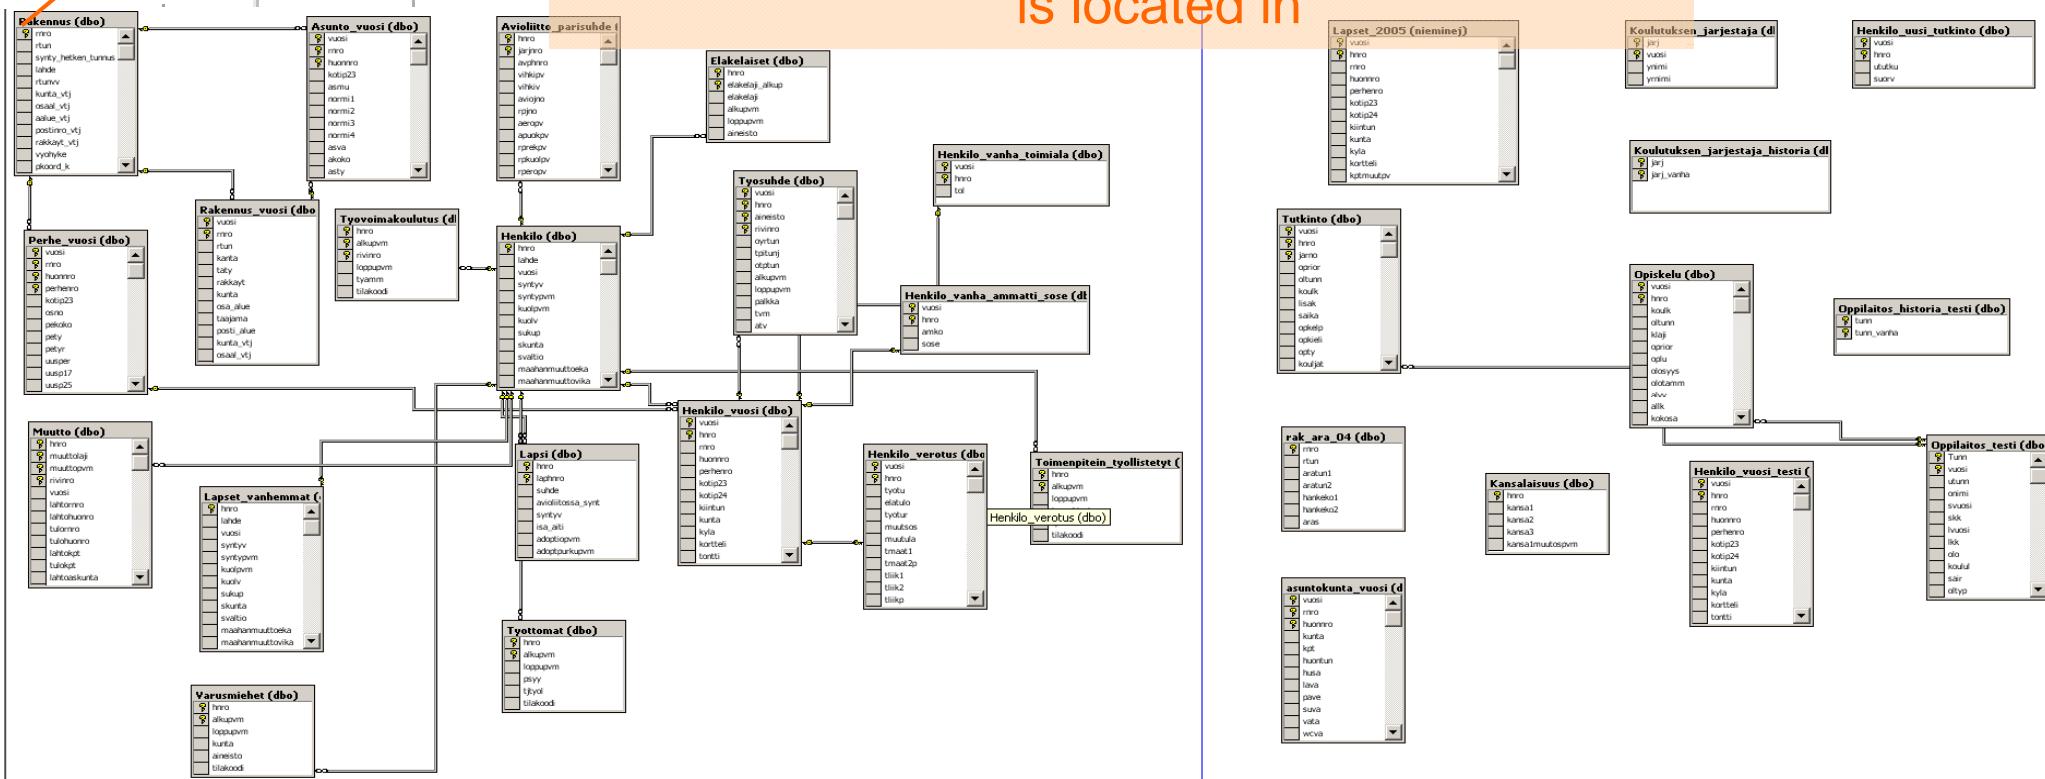

Spatiality of single unit data in the data warehouse

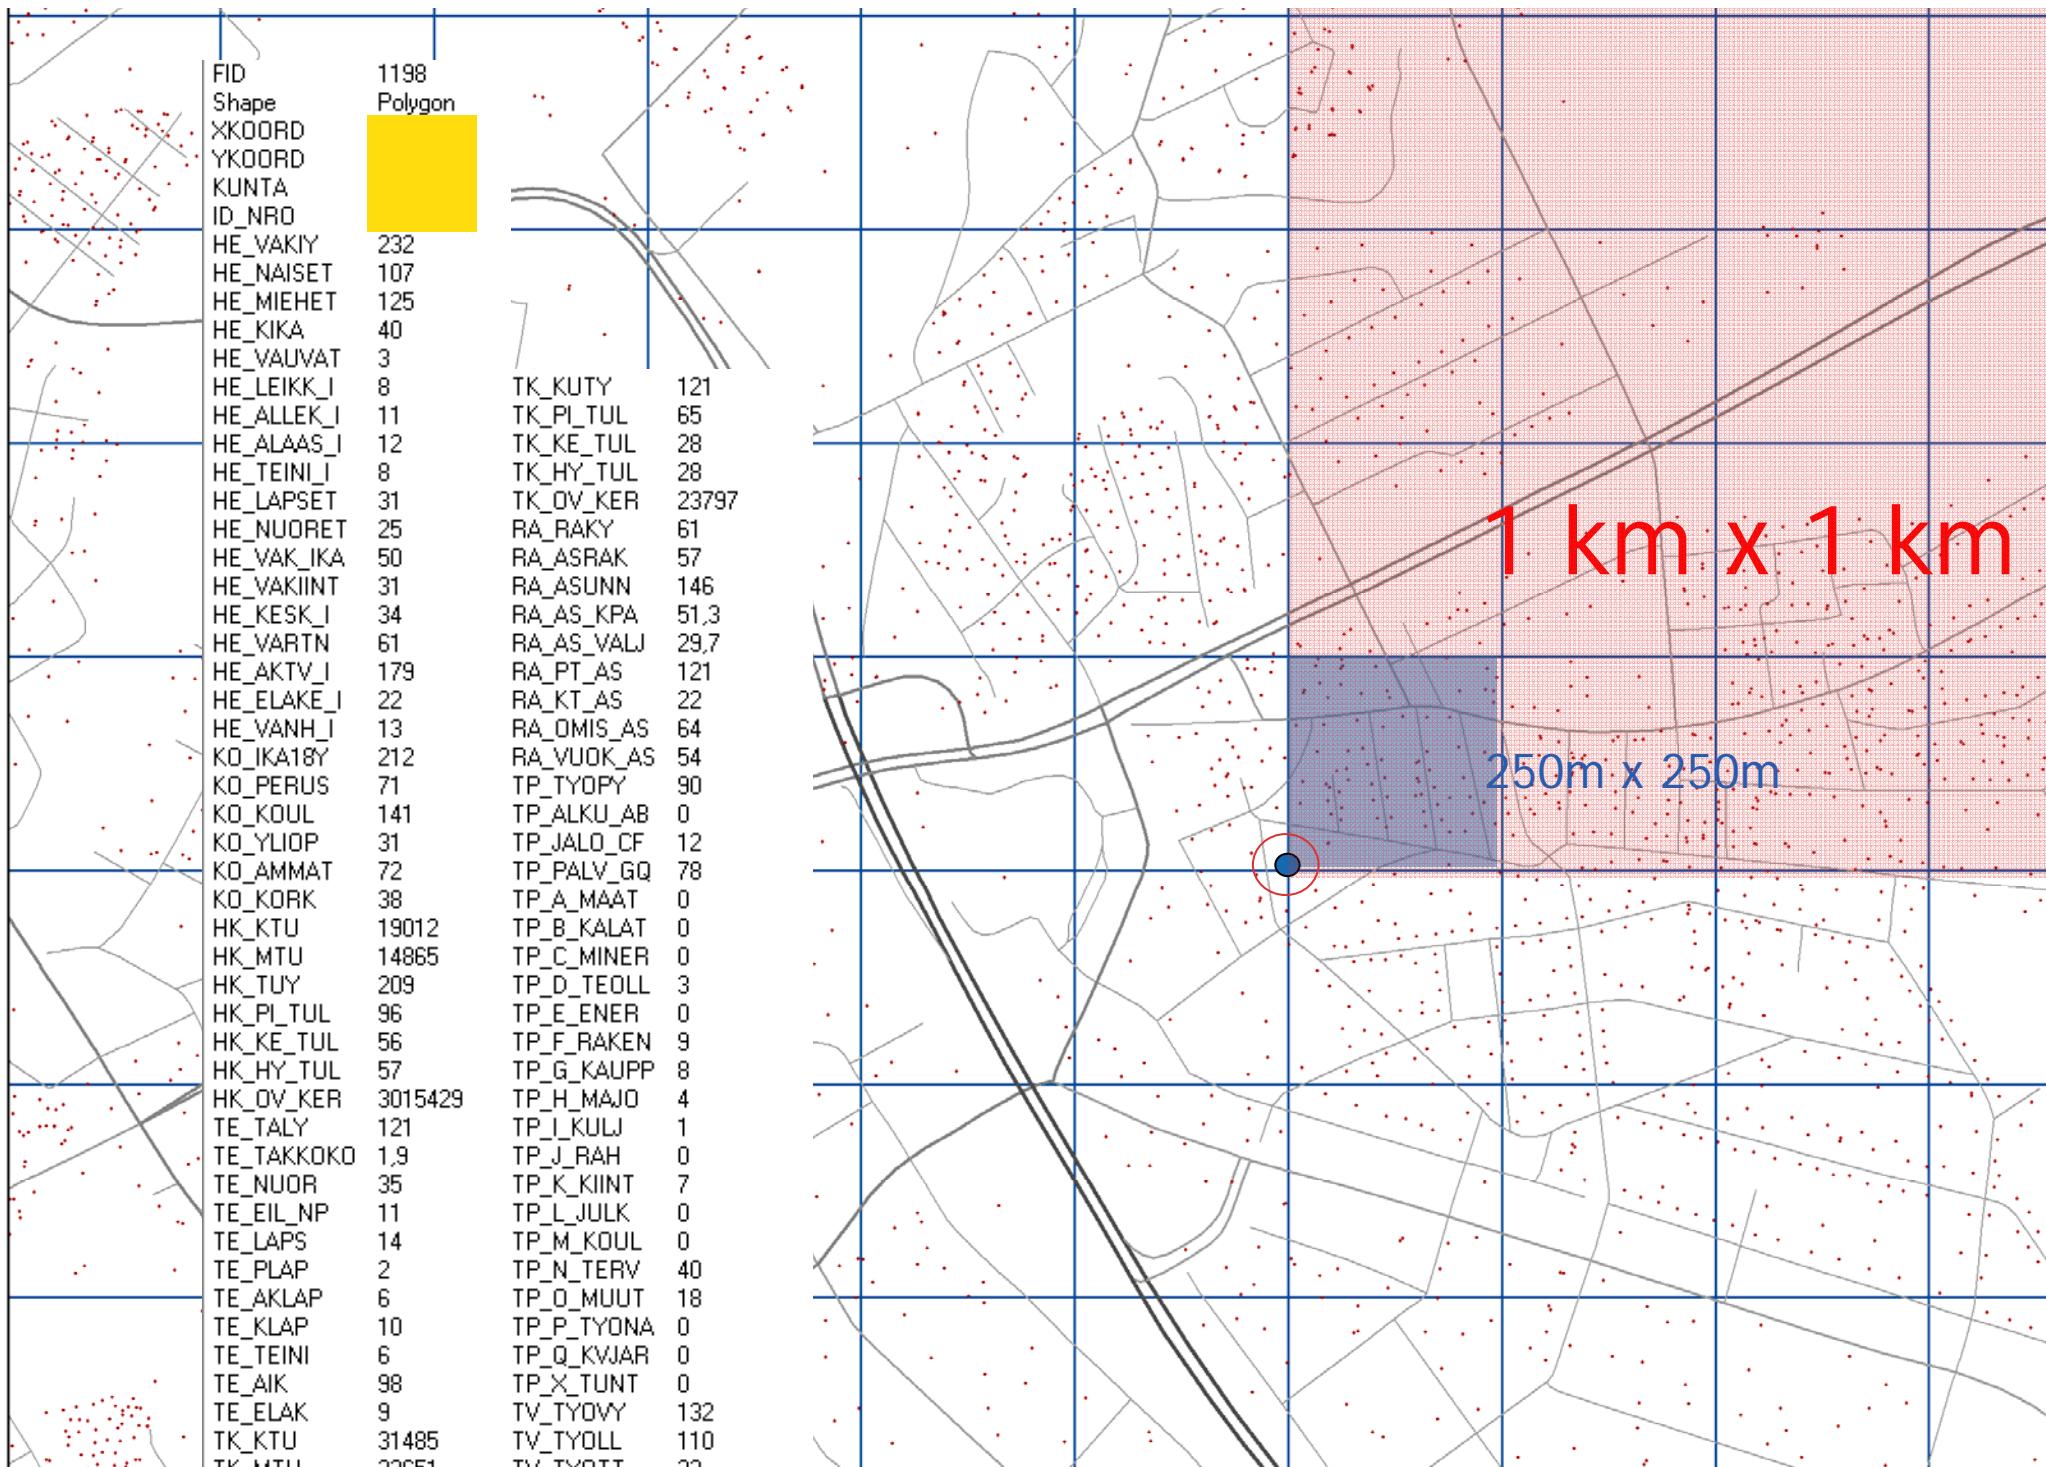

- Spatial information
only once
in the statistical production
database as well
in the data warehouse

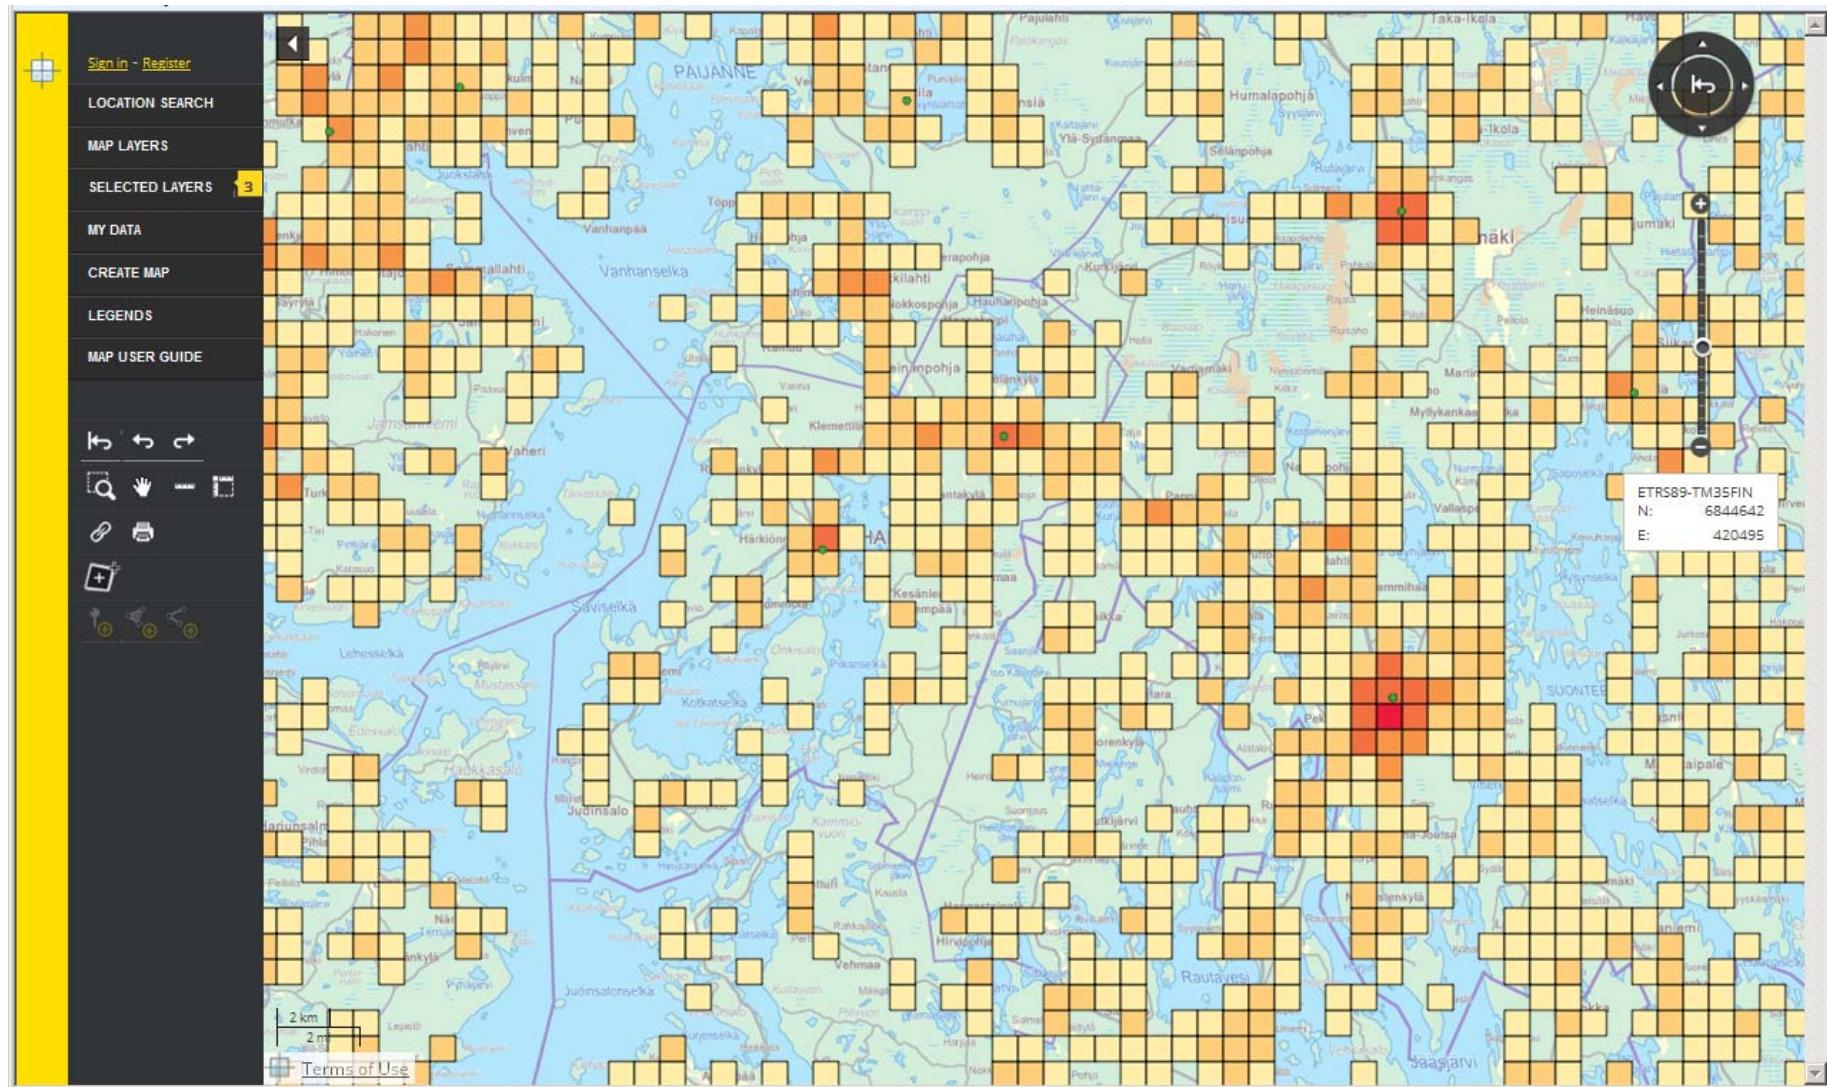

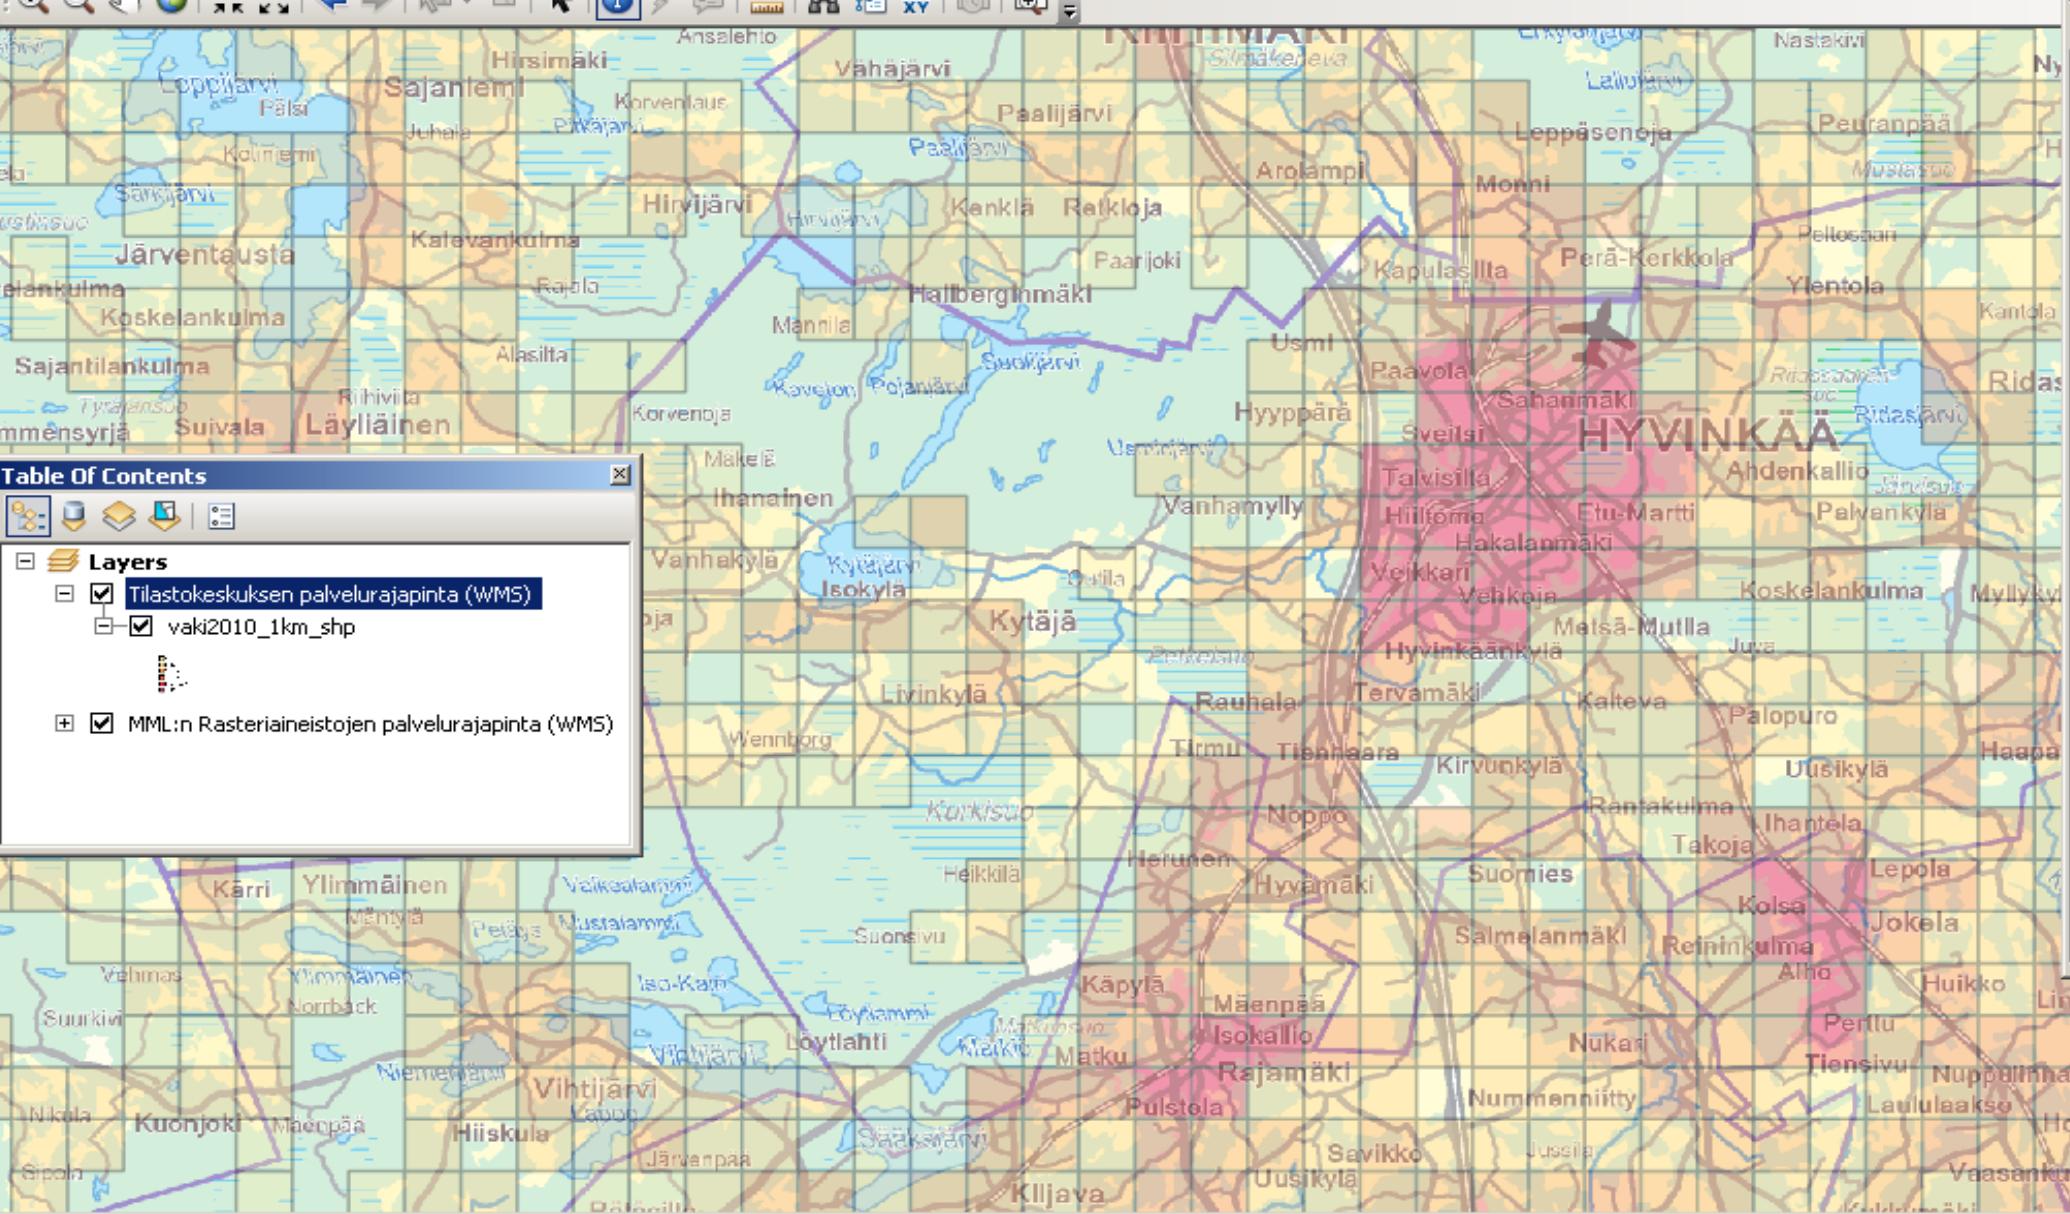

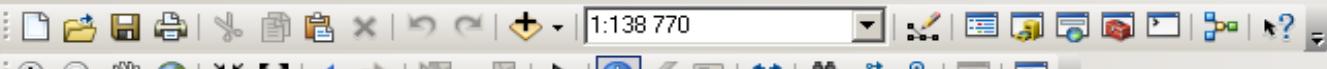

Building table -
 key to the location of buildings
 - co-ordinates of buildings
 - ID of territorial units or the grid cell the
 building
 is located in

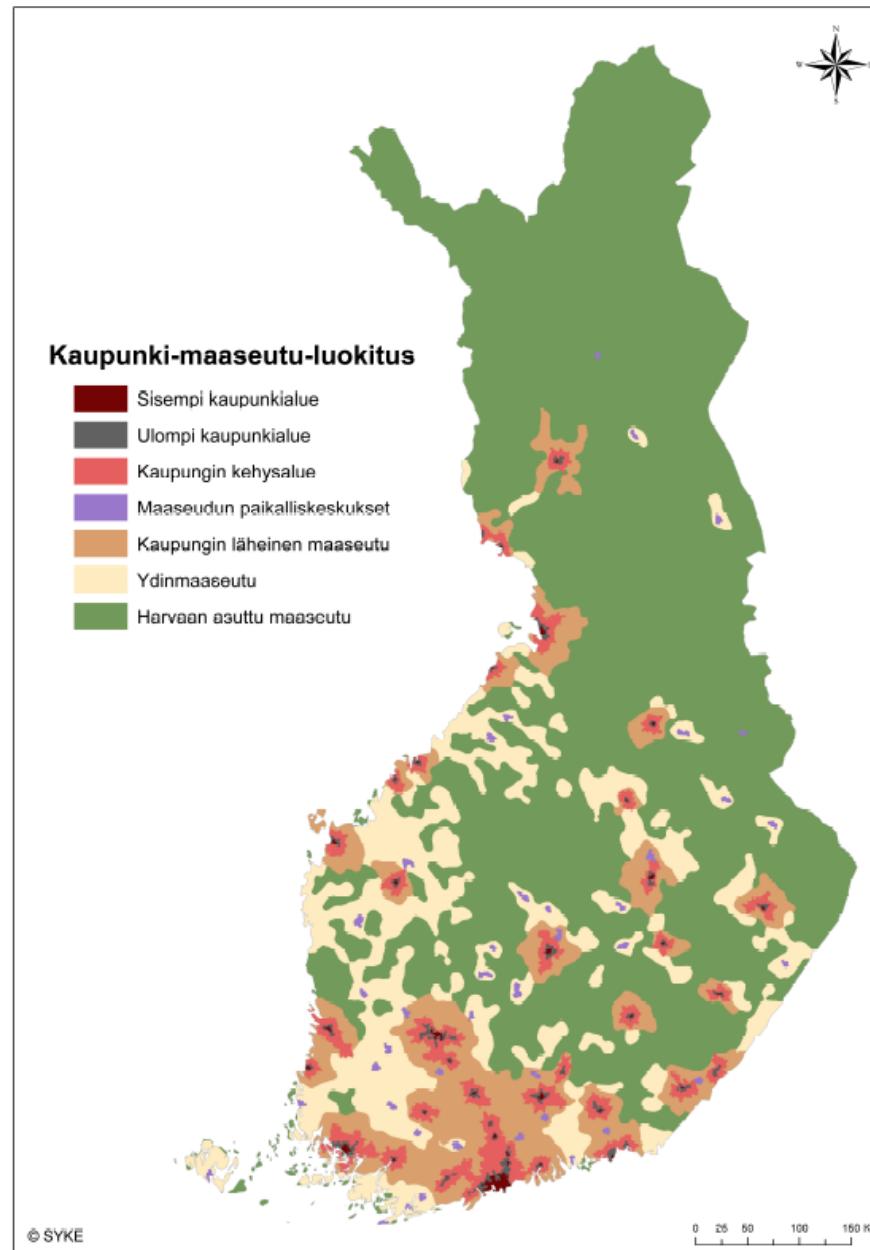

MAP WINDOW, selected layer; Population grid data 1km x 1km, 2012

New urban-rural typology based on grid data

© SYKE

0 25 50 100 150 Km

Point based geospatial statistical framework

- Strongly recommended by [GEOSTAT](#) –project and [EFGS](#)
- Points/Grids do not change (space, time)
- Grids comparable inside a country and between countries
- Grid net for harmonising statistics by different kinds of territorial units – “Location the unifying factor”
- Grids as a basic unit for compiling statistics flexibly by small to larger areas, by natural boundaries, by distances...
- Grids for comparable functional areas (e.g. urban-rural)
- Grids for spatial analysis (accessibility, neighborhood...)

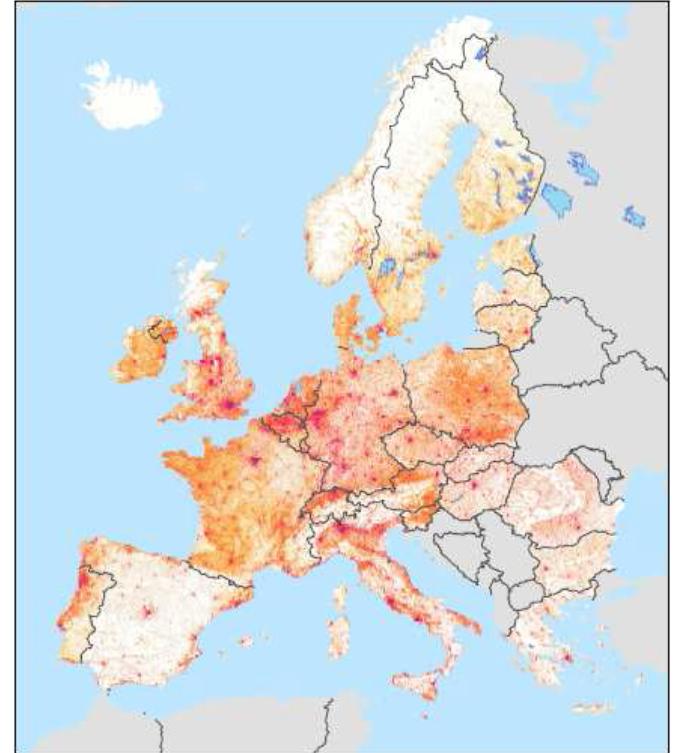

National and European cooperation

- National Advisory Committee on Information Management in Public Administration (JUHTA) – standards and recommendations
- The National Council for Geographic Information – NSDI, National Spatial Data Strategy

- [European Forum for Geostatistics](#)
- [ESSnet project Geostat](#)
- [Inspire](#)

ESSnet GEOSTAT

- Harmonised population grid data (1km x 1km grid cells) of 2006, 2011
- Guidelines to produce population grid data
- Examples of the use of grid data
- European Forum for Geostatistics <http://www.efgs.info/>

INSPIRE (Infrastructure for Spatial Information in Europe)

- The Finnish Geoportal (CSW, WMS, WFS) by the National Land Survey (today > 500 map layers by 50 data providers)
<http://www.paikkatietoikkuna.fi/web/en/map-window>
- SF's data available according to Inspire specifications since May 2013 (24 data layers)

Statistical units (Major regions, sub-regional units, municipalities, 1km x 1km grids...)

Population by statistical units (total, sex, age) incl. grids!

Educational institutions

Production and Industrial Facilities

<http://tilastokeskus.fi/tup/rajapintapalvelut/index.html>

Geospatial information at Statistics Finland

- Data warehouse with Geodatabase
- Register-based population data with links to geocoded buildings – dwellings, places of work, educational institutions, production and industrial facilities
- Small area statistics; by postal code area, municipal sub-area, grid (1km x 1km , 250m x 250m)
- Products and web services
- New developments
 - WMS, WFS services
 - Accessibility studies
 - Urban-rural classification independent of administrative boundaries

Challenges

- Confidential information on geospatial statistics
Small area statistics and data protection
small areas with few inhabitants, integration with detailed background maps...
- Budget constraints on development of data bases and new statistics
- Open data until now only statistics by administrative area free of charge in Finland
- To make the most of geospatial information also mobile data
- Understanding of the importance of harmonised spatial information – integration of statistics and geospatial information

The screenshot shows the homepage of the European Forum for Geostatistics (EFGS) Sofia Conference 2013. At the top left is a stylized globe icon with a bite taken out of it. The title "EUROPEAN FORUM FOR GEOSTATISTICS SOFIA CONFERENCE 2013" is prominently displayed in red. Below the title, it says "23-25 October, Sofia, Bulgaria" and the motto "*The Proof Of The Apple Is In The Eating!*". To the right is the EFGS logo, which consists of a grid of colored squares. Navigation links include "HOME", "INFORMATION", "LOCATION", "PROGRAMME", and "REGISTRATION". A link to "Links | Contacts | Print" is also present. The main content area features a large image of a cathedral and several smaller images of Sofia's architecture. Text sections include "Welcome to the European Forum for Geostatistics 2013 Conference website!", "European Forum for Geostatistics", "Sofia conference 2013", "Motto: 'The proof of the apple is in the eating'", "Focus: Spatial Statistics from different data sources (census, registers, surveys, mobile telephones etc.) with...", and "Deadlines: Registration Start 7th of June 2013 End 30th of September 2013; Submitting Abstracts Start 24th of June 2013 End 20th of September 2013".

Thank you for your attention!
