Outline

• About MDA Geospatial Services

• Support to the United Nations

• Climate Change and Disaster Management
  • Context and Challenges
  • Relation to Sustainable Development Goals
  • Increasing Geospatial Information Value and Accessibility

• Some Considerations for the Panel
About MDA Geospatial Services

The market leader in the operational delivery of time-sensitive, business process-specific, geospatial information

- Designs and delivers near real-time solutions based on geospatial data for operational environments
- Delivers operationally-responsive, 24/7 support for just-in-time decision making
- Operates the RADARSAT-2 mission and delivers radar imagery worldwide
- Provides single source access to a broad range of optical satellite missions
### Operational Capabilities Servicing Global Markets

Support to the United Nations

• MDA has been under contract to the United Nations since 2004, providing satellite imagery to 39 UN entities.

• Imagery products benefit a variety of UN projects with strategic intelligence and information enabling enhanced decision making

• Projects include:
  • Peace Keeping Base Mapping and Surveillance
  • UNODC Illicit Crop Monitoring
  • UN Security Council Situational Awareness
  • FAO Food Security Issues
Climate and Disasters: Context and Challenges

- Climate change and disasters have a significant impact on the well-being of the global population.
- Geospatial information has an important role to play in monitoring and mitigating the impact of climate and disaster-induced change.
- Further, to support the achievement of sustainable global development goals, it is imperative that we work to increase the value and accessibility of geospatial information.
# The Role of Geospatial Data in Achieving Sustainable Development Goals

How can we assess the impact that changes in global sea ice will have on vulnerable coastal populations and ecosystems?
Disaster Mitigation – Managing Prevention, Response

How can we best equip emergency responders with timely information to direct resources to where help is needed most?
Maximizing Value Needs a Multi-Source Approach

Each sensor platform has its own capabilities and benefits. Increased value and information content is achieved using a multi-source approach.

Latency and Response Times Are Critical

- Geospatial information value is time limited for many applications.
- Geospatial information is not just about where and what, but:
  - When?
  - Still relevant?
  - What is changing?
- Reducing latency and response applies to both:
  - Tasking of new collections
  - Post-collection product delivery

The world is dynamic. Need to think not only geospatial… but geotemporal.
A global network of direct satellite access infrastructure minimizes latency.
Geospatial information products need to be designed to answer the specific questions of target users and integrate directly with user workflows.
Climate Change is Geographically Extensive

- Questions of climate change are global in nature.

- Climate change processes span large spatial and temporal scales.

- Extensive and repeat geographic coverage are required to observe and characterize climate-related changes.

Broad area, repeat monitoring is fundamentally valuable – it’s not just about resolution.
Geospatial Big Data and the Mobile World

- Increasingly large geospatial data sets create new opportunities for data mining and analytics to support climate change and disaster management.

- Effective access, manipulation and analysis of these data sets requires new approaches, tools, and algorithms (e.g. crowd sourcing, cloud based computing)

- Geospatial information products need to be designed and optimized for the mobile world that disaster responders live in.
Policy and Standards Related Challenges

- Each satellite operator has its own regulatory, access, and licensing policies. Achieving a harmonized solution across multiple operators is often very complex.

- The processes and mechanisms required to order data from different satellites are not standardized, making it difficult for users to create and submit requests that meet their needs.

- Product formats are reasonably standardized but there remain some issues across different standards and data sources that inhibit use.

A single-channel satellite remote sensing data broker offers unique value to the diverse requirements of organizations like the UN.
In Conclusion: Some Considerations for the Panel

• How can the climate change and disaster management community best take advantage of new generation sensors?

• During disasters, how fast is fast enough when it comes to geospatial information product delivery?

• What do we need to do to foster the development of information services that better target the requirements of the users we serve?

• How can the climate change community better access and take advantage of the geospatial big data sets collected of our planet?

• How can we minimize the barriers created by different licensing and commercial approaches in the context of disaster response?
Thank You
