

ORDNANCE SURVEY

Future Trends in Geospatial Information Management

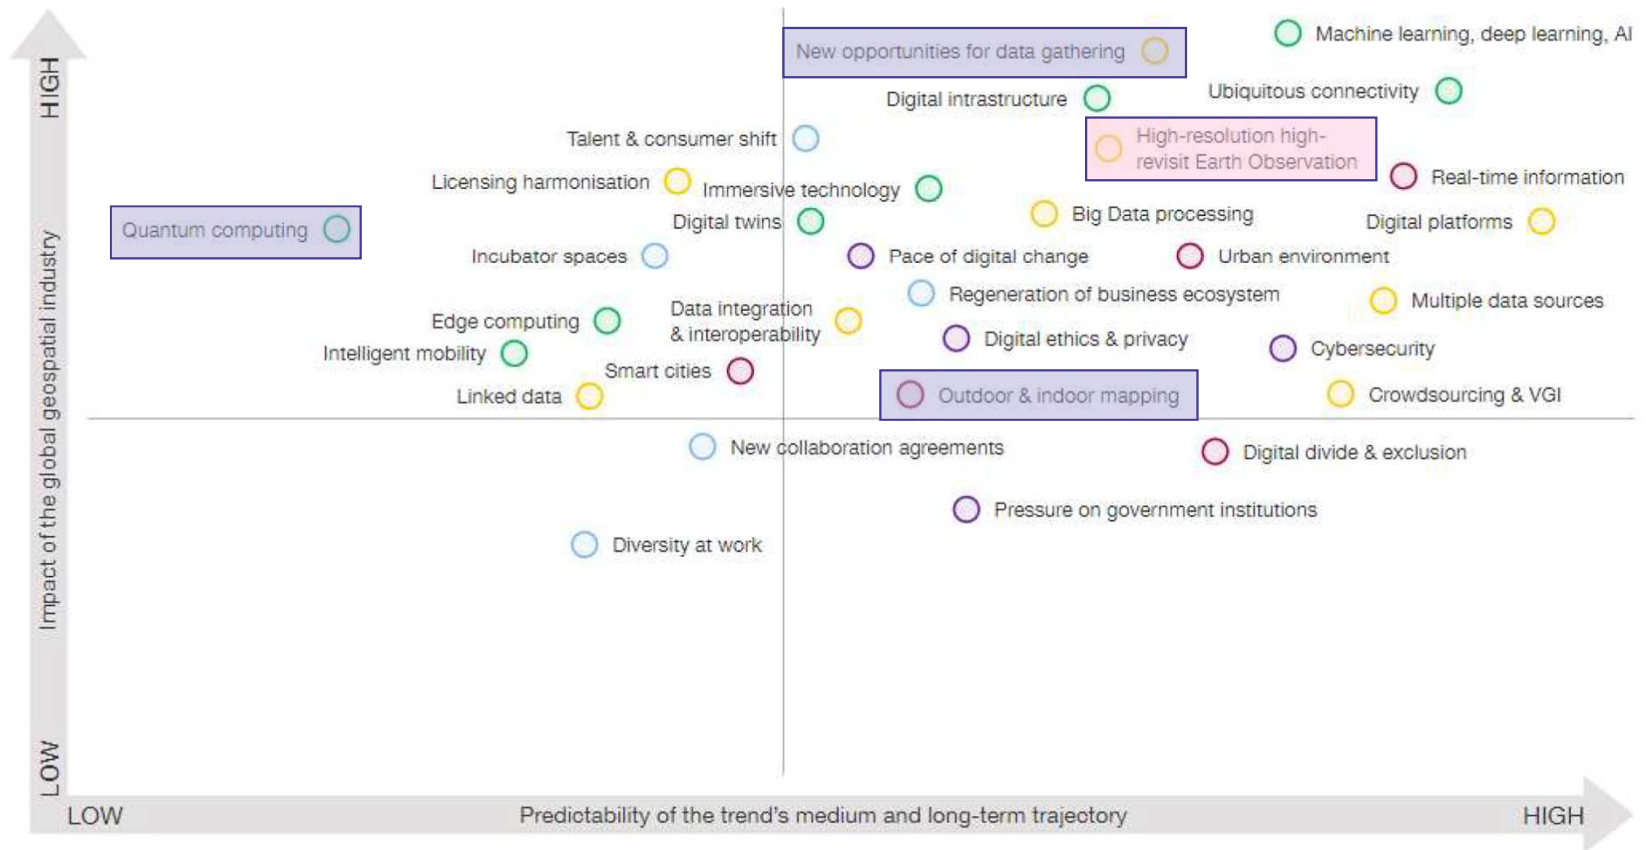

Technical Trends

Jeremy Morley
Chief Geospatial Scientist

Graphic 1.

Five drivers will advance change in the global geospatial information management landscape over the next 5 to 10 years

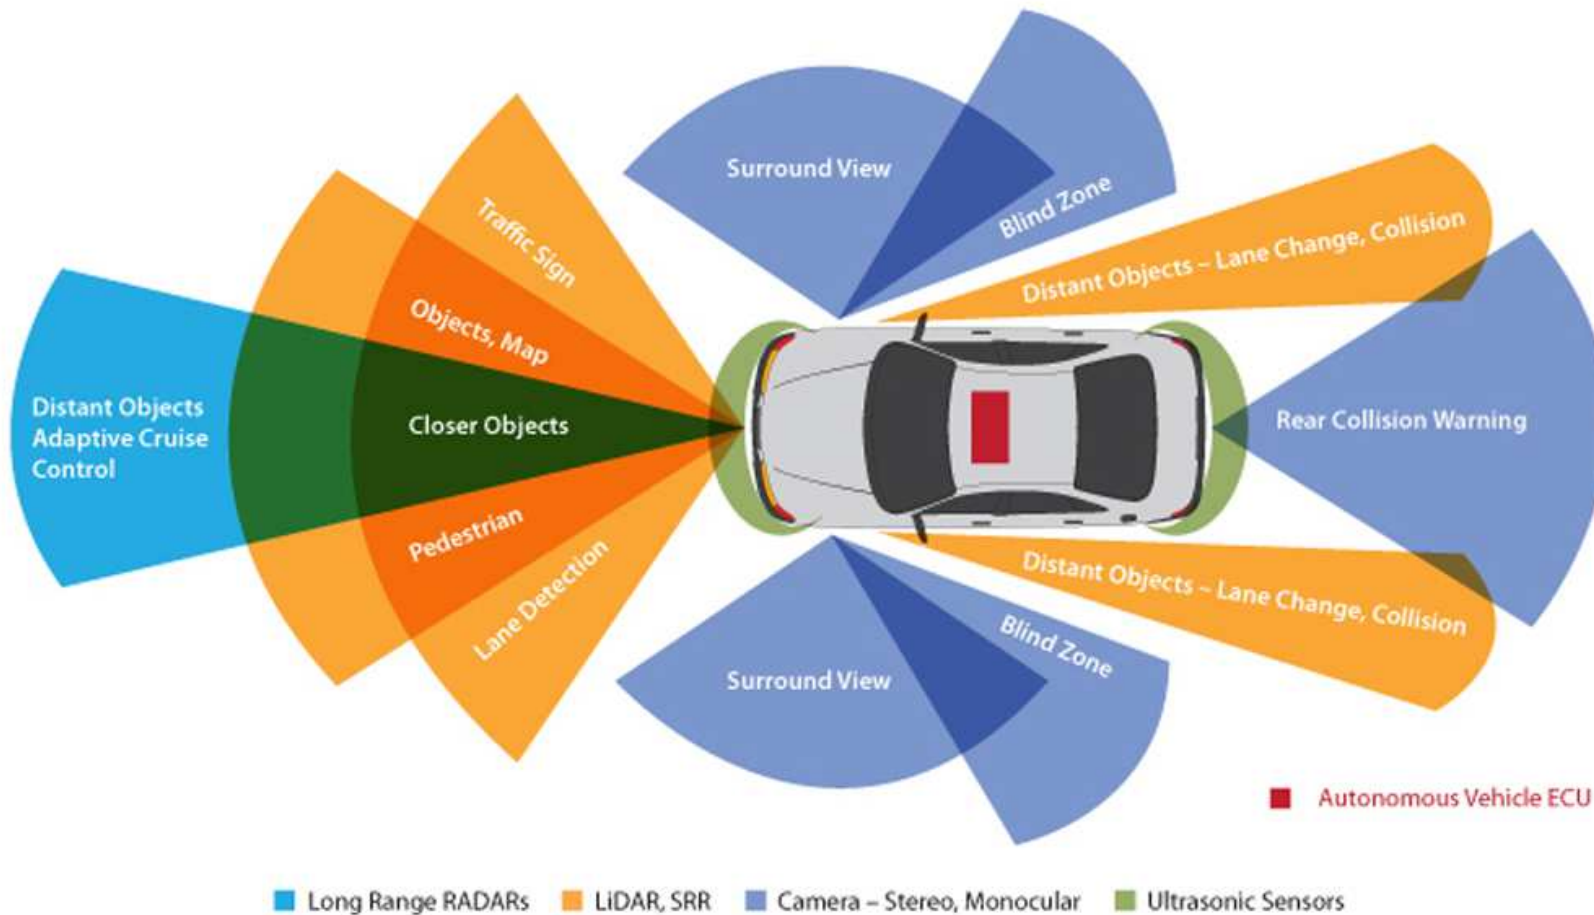

Five prevailing drivers and an underlying set of trends

- Technological advancements
- Evolution of user requirements
- Rise of new data sources & analytical methods
- Legislative environment
- Industry structural shift

New opportunities for data gathering

Vehicles as sensor platforms

Example system:
Tata Elxsi's
'Autonomai' (2017)

From:

Sensors and HD Mapping

Courtesy of Ordnance Survey's E-CAVE team

OS-Mobileye two ways of seeing the world

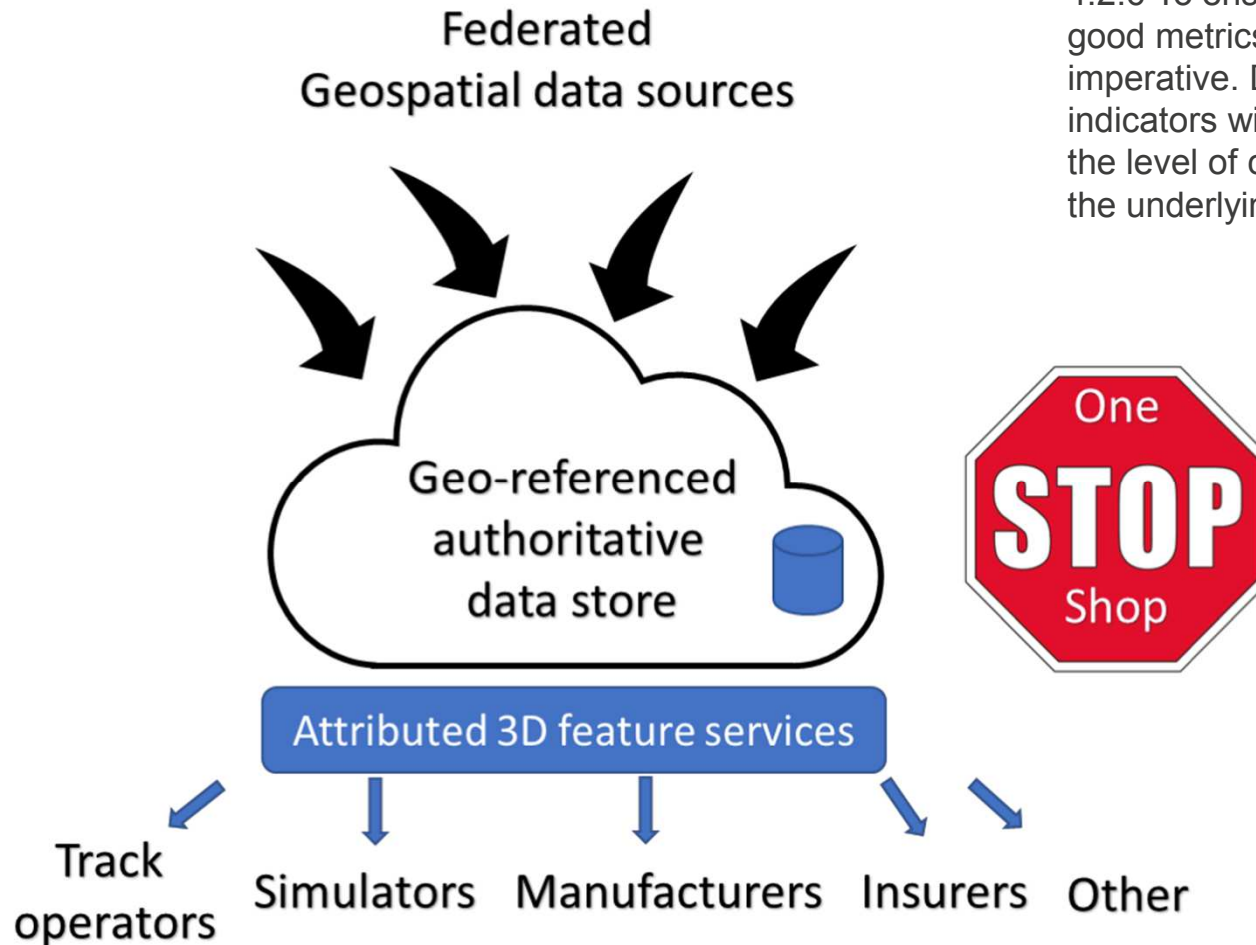

Relative - A car centric view of the world

Absolute - Eastings, Northings or GPS lat-lon

Neutral georeferenced data

4.2.6 To ensure consistent accurate data good metrics about data quality are imperative. Displaying data quality indicators will enable the user to consider the level of confidence they should have in the underlying information.

Quantum computing

Quantum computing

Based on “qubits” – rather than a traditional bit which holds a 0 or 1 value only.

Qubits actually store the *superposition* of every possible quantum state, so a single qubit can hold two binary values at once, meaning a single operation can be carried out on 2^n values simultaneously, where n is the number of qubits. The power of the quantum computer storage scales exponentially with the number of bits.

A quantum computer uses other quantum physics laws such as *entanglement* (the “spooky” at-a-distance connection between quantum objects) and *interferences* to operate.

Qubits & quantum computers currently require very specialised hardware – ions at microkelvin temperatures or superconductors. They are not very fault tolerant, and the qubit state (the 0 vs 1 condition) cannot be indefinitely maintained (*decoherence* of the state).

Example uses of quantum computing

Optimisation problems

- Not usually suitable for brute-force algorithms, testing permutations of options one at a time
- The superposition scale-up in quantum computers should allow much larger scaling up in algorithms
- An example optimisation problem is planning in **logistics**

Machine learning

- ML techniques allow big data analysis to find patterns in large datasets, e.g. using cloud computers
- “Lately, because of the rapid growth of the size of datasets, the dimensionality of the input and output space, and the variety and structure of the data, conventional learning techniques have started to show their limits.” L.Oneto, S.Ridella, D.Anguita 2017
- Quantum computers show promise for exponential speedup of clustering algorithms, e.g. “q-means” to replace k-means: <https://towardsdatascience.com/quantum-machine-learning-a-faster-clustering-algorithm-on-a-quantum-computer-9a5bf5a3061c>
Kerenidis, Landman, Luongo, Prakash, 2019 “q-means: A quantum algorithm for unsupervised machine learning “, 33rd Conference on Neural Information Processing Systems (NeurIPS 2019), Vancouver, Canada.

Example resource

<https://www.ibm.com/quantum-computing/learn/what-is-quantum-computing/>

The screenshot shows the IBM Quantum website interface. At the top, there is a navigation bar with the IBM logo, 'Quantum', and dropdown menus for 'Network', 'Technology', and 'Resources'. A blue button labeled 'Launch IBM Quantum Experience' is in the top right. The main content area features a video player with the title 'Introduction to Quantum Computing Expert Explains One Concept in 5...'. The video player includes standard YouTube controls like 'Watch later', 'Share', and 'Info'. A large purple text overlay is positioned over the video, containing the quote: "We're either at the vacuum tube or transistor stage [...] trying to invent the integrated circuit". Below the video, there is a 'MORE VIDEOS' button and a description of the video content.

"We're either at the vacuum tube or transistor stage [...] trying to invent the integrated circuit"

New to quantum computing? Check out this video from WIRED with Dr. Talia Gershon, Senior Manager of Q Experiences at IBM Research.

In it, she explains quantum computing to a child, a teenager, a college student and a graduate student, and then discusses quantum computing myths and challenges with Professor Steve Girvin from Yale University.
