Content

1. Great improvement of remote sensing capabilities
2. New requirements for remote sensing
3. Natural disaster monitoring using remote sensing
4. Remote sensing risk management for insurance industry
5. Conclusion and prospect

1. Great improvement of remote sensing capabilities

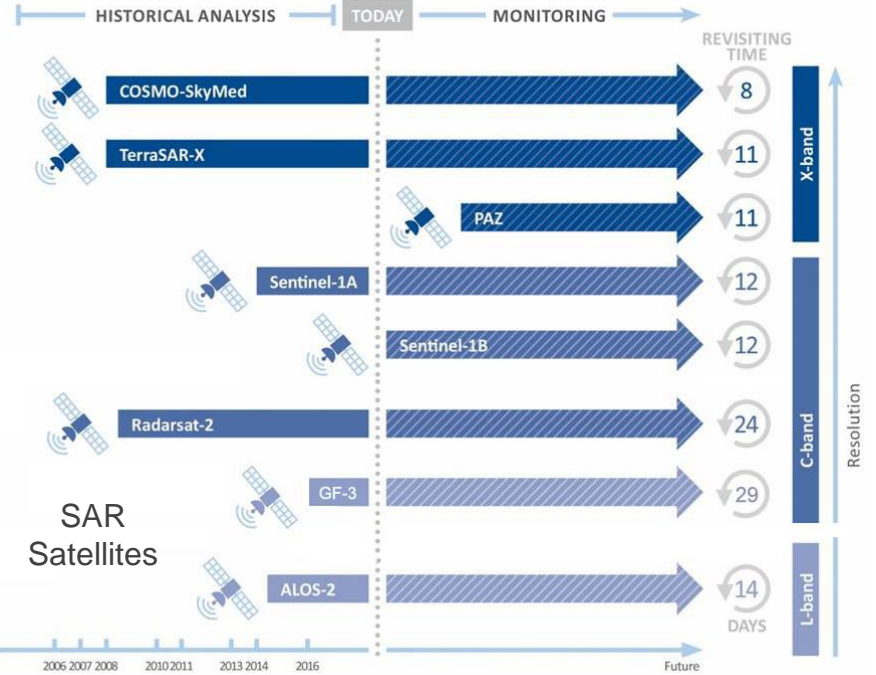

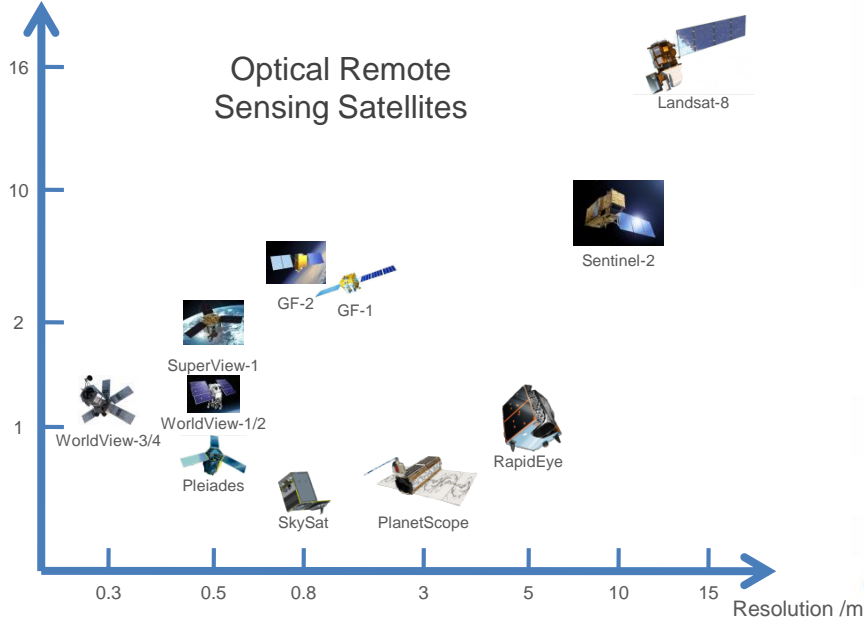

- More and more data sources
 - Satellites, aircraft, vehicles, etc
 - Optical, SAR, etc.
- Higher and higher resolution
 - Optical: better than 0.5m
 - SAR: better than 1m
- Faster and faster delivery speed
 - Optical: within 5 hours
 - SAR: within 1 hour

1. Great improvement of remote sensing capabilities

Revisit frequency /d

So many satellites, various resolutions, different beam mode, are ready for us to provide better remote sensing services.

2. New requirements for remote sensing

- Continuous and stable monitoring
- Quickly response
- Automatically indentify ground features and their changes
- Accuracy meets the requirements

3. Natural disaster monitoring using remote sensing

- Most surface deformation disaster could be continuously monitored by using satellite data.
- Comparison shows remote sensing technology such as InSAR has similar accuracy with traditional measurement.
- Early warning for several natural disaster could be achieved using InSAR (Interferometry SAR).

InSAR applications for ground deformation

Ground Subsidence

Earthquake

Mining Area

High-Speed Railway

Subway

Bridge

Landslide

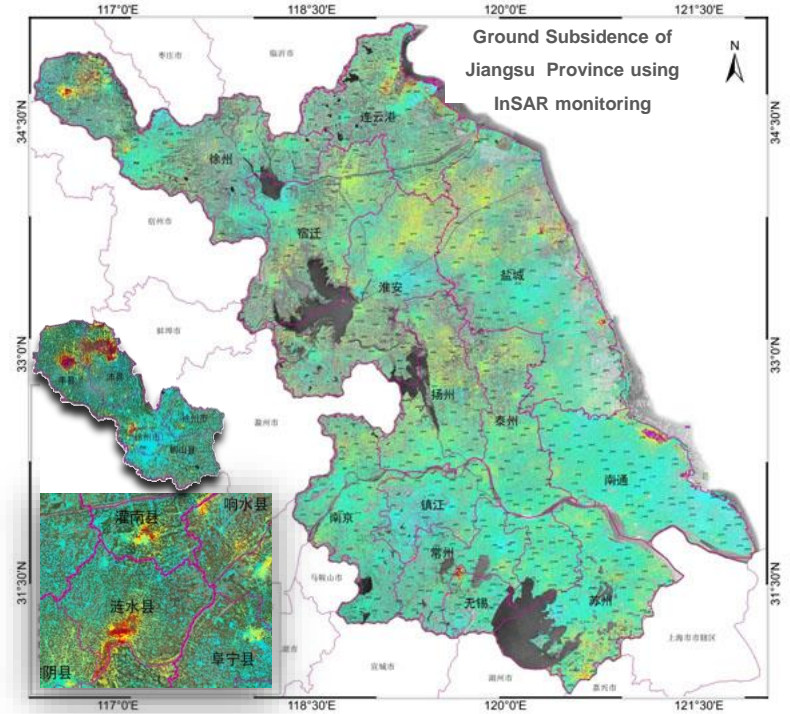

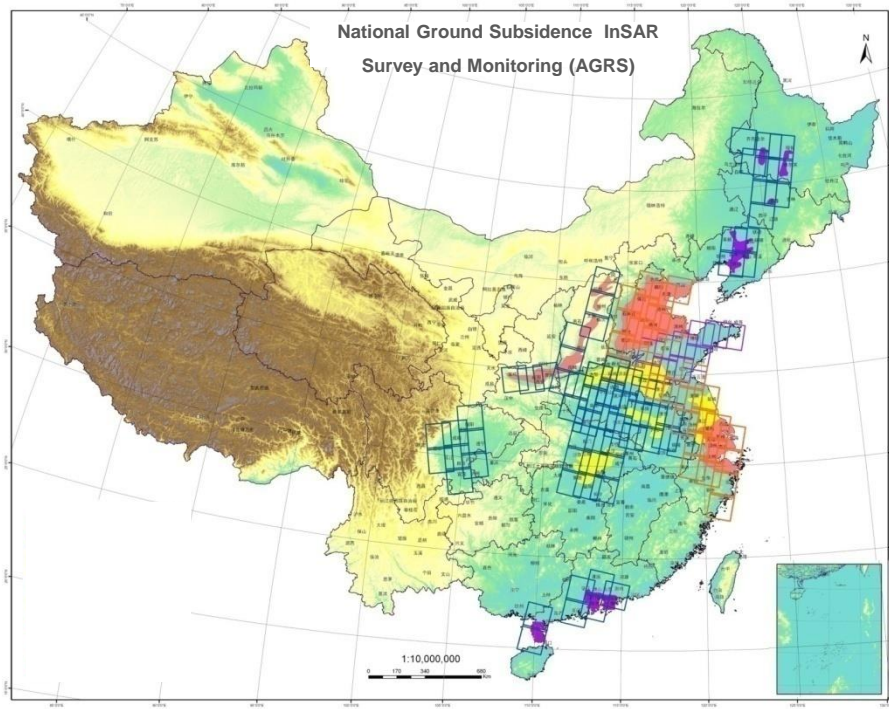

Dam

Transmission Tower

Wide area ground subsidence monitoring in China

Deformation disaster monitoring and early warning

- Mining area subsidence monitoring

Natural disaster monitoring and early warning

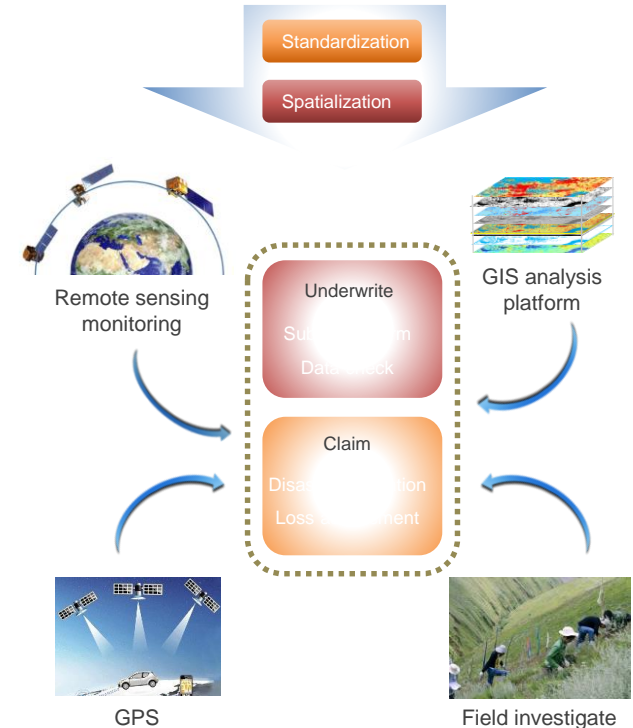

- Combining with optical remote sensing, GB-InSAR, GNSS and LiDAR, satellite-based InSAR technology could early recognize disaster and continuously monitor it.

4. Remote sensing risk management for insurance industry

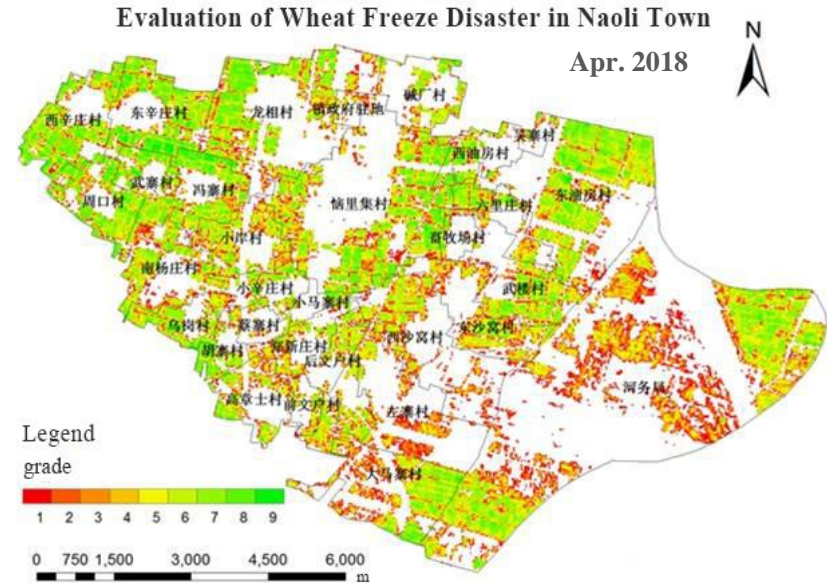

- Insurance companies need real-time data to determine facts.
- Remote sensing could provide data and bring innovation to the agricultural insurance companies.
- It can help agricultural insurance companies to
 - Underwrite
 - Investigate
 - Claim

Risk management for agricultural insurance: crop freeze

- Crop damage could be identified from satellite imagery.
- Insurance companies could use this information to investigate and claim.

Risk management for agricultural Insurance: flooding

- Disaster such as flood could be recognized from satellite imagery.
- Insurance companies could use this information to see whether the insurers' vegetable farm was damaged or not.

Aug. 10th ,2018, before flooding

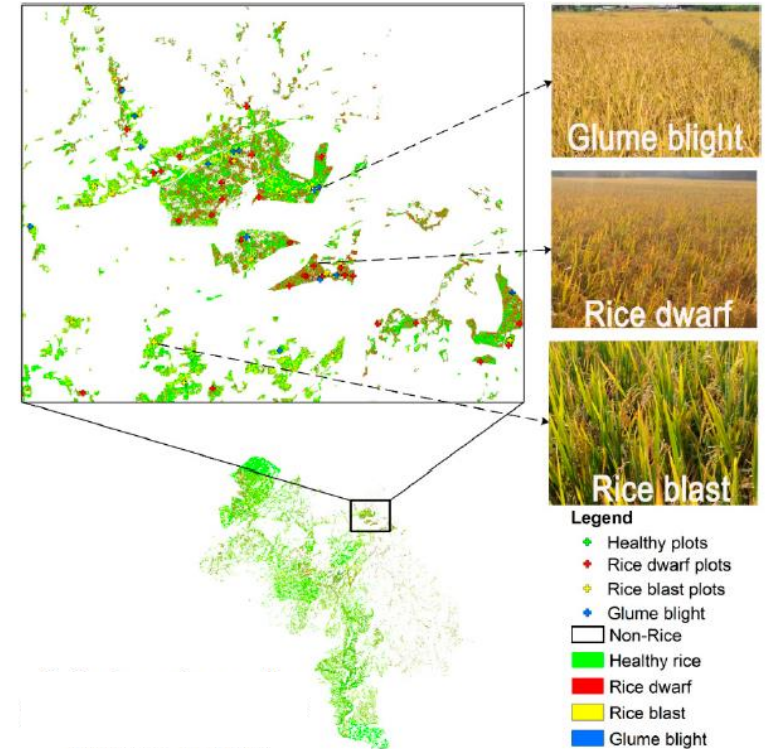

Aug. 21st ,2018, after flooding

Risk management for agricultural insurance: crop diseases

- Crop diseases information could be extracted from remote sensing imagery.
- Insurance companies could use this information to analysis whether the insurers' rice farm was suffered from diseases.

5. Conclusion and prospect

- More and more companies will provide remote sensing application **technology services** for various industries instead of selling remote sensing data.
- Remote sensing **cloud platform** is necessary.
- How to use **AI and machine learning** to extract useful information efficiently from remote sensing **BIG DATA** will become the key in the future's remote sensing applications.

An aerial architectural rendering of a futuristic city. The central focus is a large, circular, glowing structure with a blue and white patterned surface, resembling a large-scale solar panel or a futuristic arena. This structure is surrounded by a body of water and lush greenery. A road with several cars leads towards the structure. In the background, there are modern buildings, including a prominent cylindrical tower. The overall scene is bright and optimistic, suggesting a sustainable and advanced urban environment.

Thanks!
