# Trends

---

- Adaptive design
- Mobile technologies and increased automation in the field
- Big data / paradata
- Focus on addresses for survey frames

# Background

# Planning for the 2020 U.S. Census

---

- Contain costs
  - Design and conduct a census that costs less per housing unit than the 2010 Census while maintaining high quality
  - Identify cost drivers and implement innovative enumeration methods aimed at reducing these costs
- Plan based on research and testing
  - Focus early research and testing program on major innovations to the design of the census oriented around major cost drivers of the 2010 Census

# Census 2020 Objectives

---

- Contain costs
- Increased use of addresses
  - A redesigned address canvassing operation
- Optimize self-response program
  - Increase self-response options
  - Make use of electronic contact strategies and methods
- Maximize internet response
  - Increase awareness of the internet option
  - Encourage respondents to respond via the internet
- Continue small area geographies for data users

# Decennial Census Cost Drivers

---

- Need for nationwide updating of address list prior to Census
- Diversity of the population
- Demand for improved count accuracy
- Declining response rates
- Management of major acquisitions, schedule, and budget
- Field Infrastructure

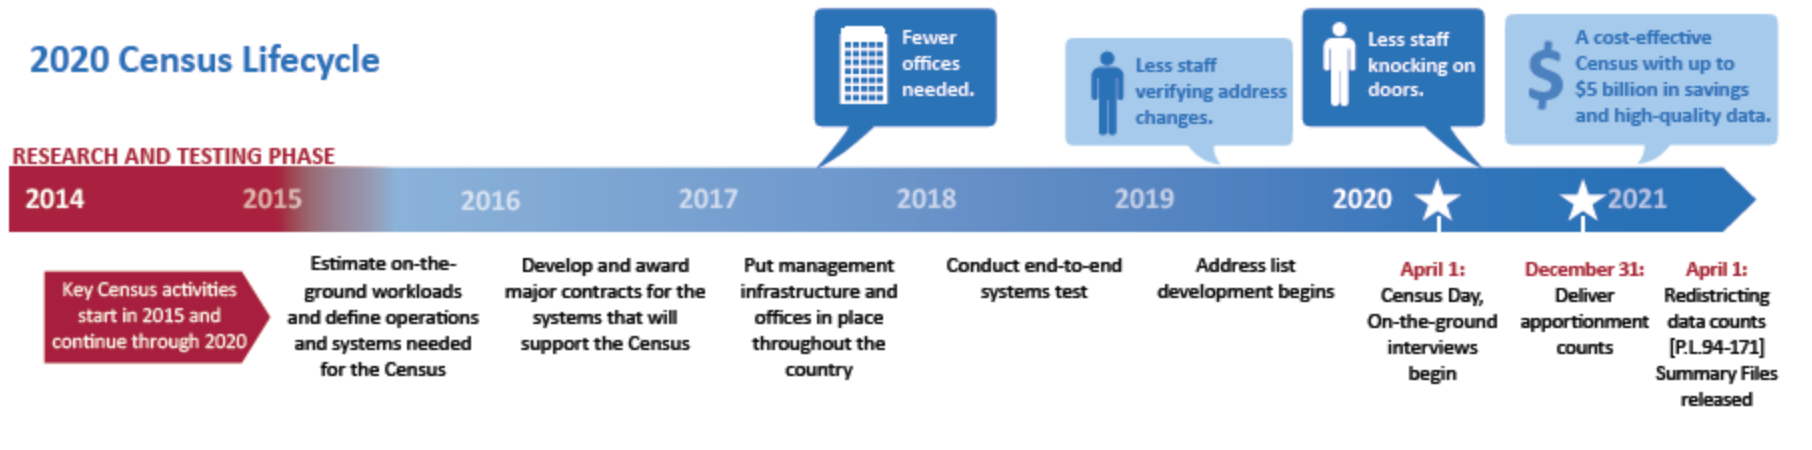

# Decennial Census Research Relative to Cost-Drivers

---

- Redesigned Address Canvassing Operation
- Administrative and Commercial Records
- Use of Mobile Technologies
- Streamlining and Automating Field Management and Operations
- Optimizing Self Response

# Key Milestones Steps Towards 2020 Census

## 2020 Census Lifecycle

# Adaptive design

# Adaptive Design

---

- A data collection is adaptive to the extent that it:
  - Plans fieldwork to achieve cost and quality goals
  - Monitors process data and cost and quality indicators
  - Uses auxiliary frame data to tailor contact approaches (or impute or adjust)
  - Uses auxiliary data, paradata and response data to change contact approaches rapidly
  - Strikes data-based cost/quality tradeoffs

# Adaptation is NOT New

---

- Sub-sampling non-respondents
- Increasing contacts
- Timing contacts
- Increasing incentives
- Tailoring survey invitations
- Tailoring refusal letters
- Switching modes

# Some Adaptations ARE New

---

- More centralized, less ad hoc, more timely efforts, e.g.
- Using auxiliary data to tailor contacts
- Using auxiliary data, paradata and response data to alter contacts
- Switching modes based on auxiliary data, paradata and response data
- Motivated by a plan and enabled by new systems

# Optimizing Self-Response

---

- Internet data collection
- Adaptive contact strategies
- New contact modes
  - Telephone
  - E-mail

# Mobile Technologies and Increased Automation in the Field

# Major Changes for Field Operations

---

- Using automation to support processes
  - Optimized daily enumerator assignments of respondent contact attempts
  - Near real time operations information for decision making
  - Enhanced operational control system
  - Automated training for enumerators and managers
- New field structure, including field staff roles and staffing ratios

# Mobile Technologies

- Routing
- Navigation
- Data Collection

# Field Reengineering and Nonresponse Followup (NRFU) using Administrative Records and Adaptive Design

---

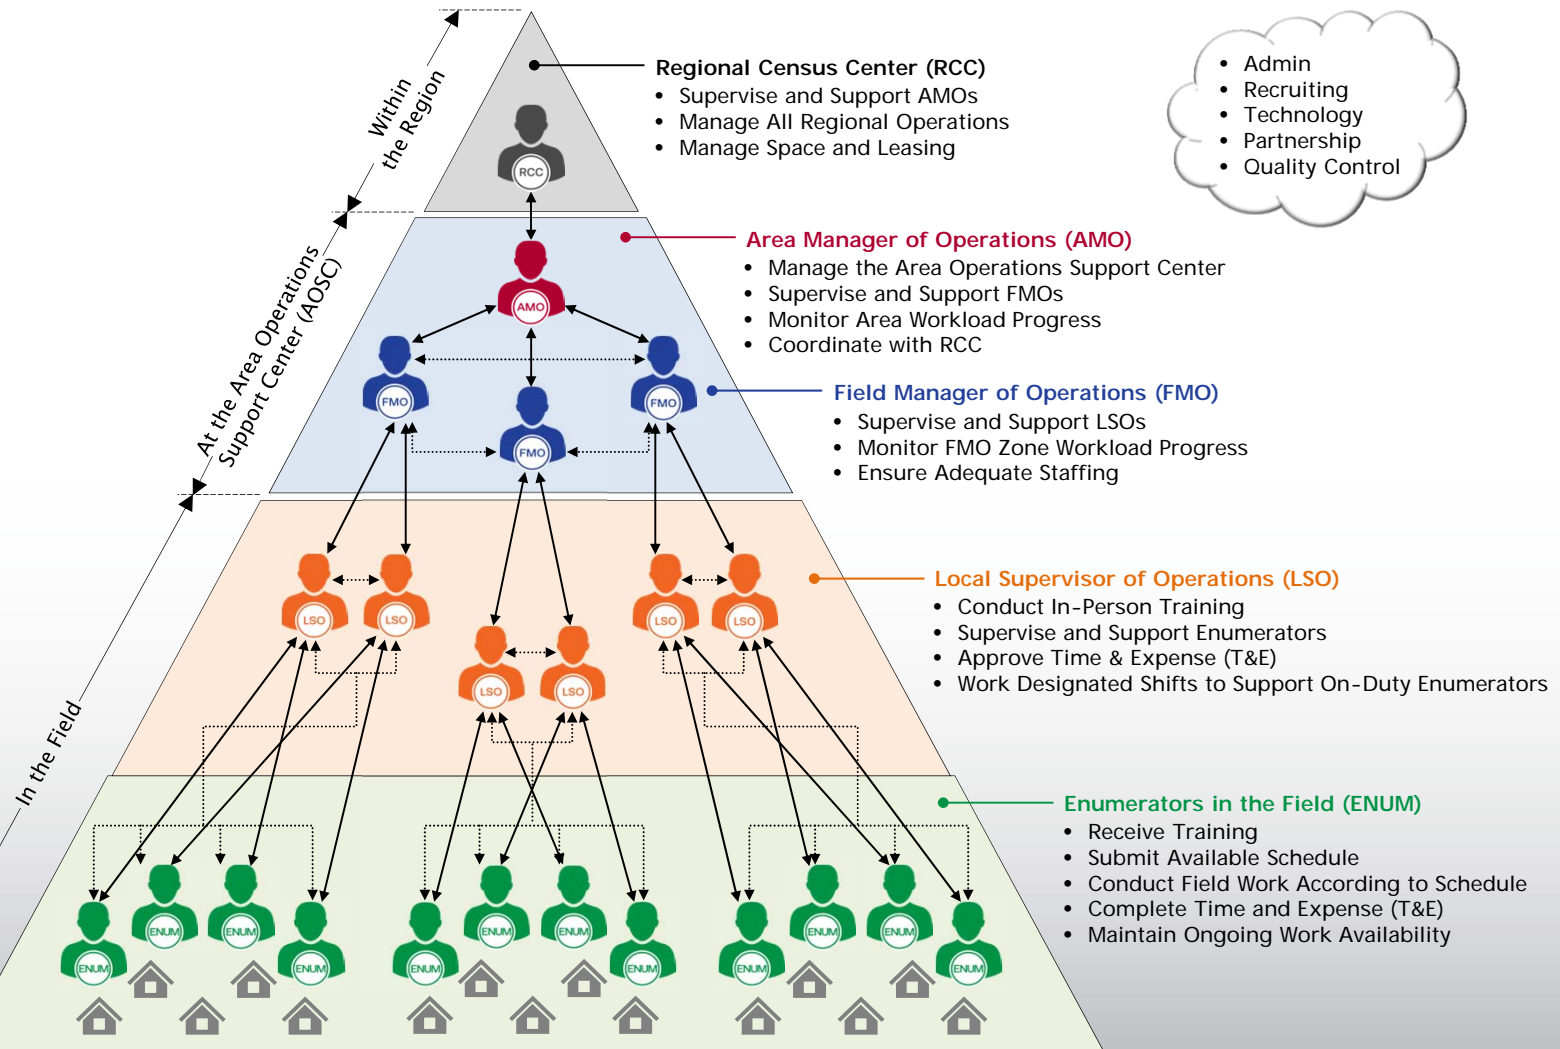

- Reengineer the roles, responsibilities, and infrastructure for the field
- Evaluate the feasibility of fully utilizing the advantages of technology, automation, and real-time data to transform the efficiency and effectiveness of data collection operations
  - Move to automated training for enumerators and managers
  - Test and implement routing and/or navigation
  - Reengineer the approach to case management

# Field Reengineering and NRFU using Administrative Records and Adaptive Design (cont.)

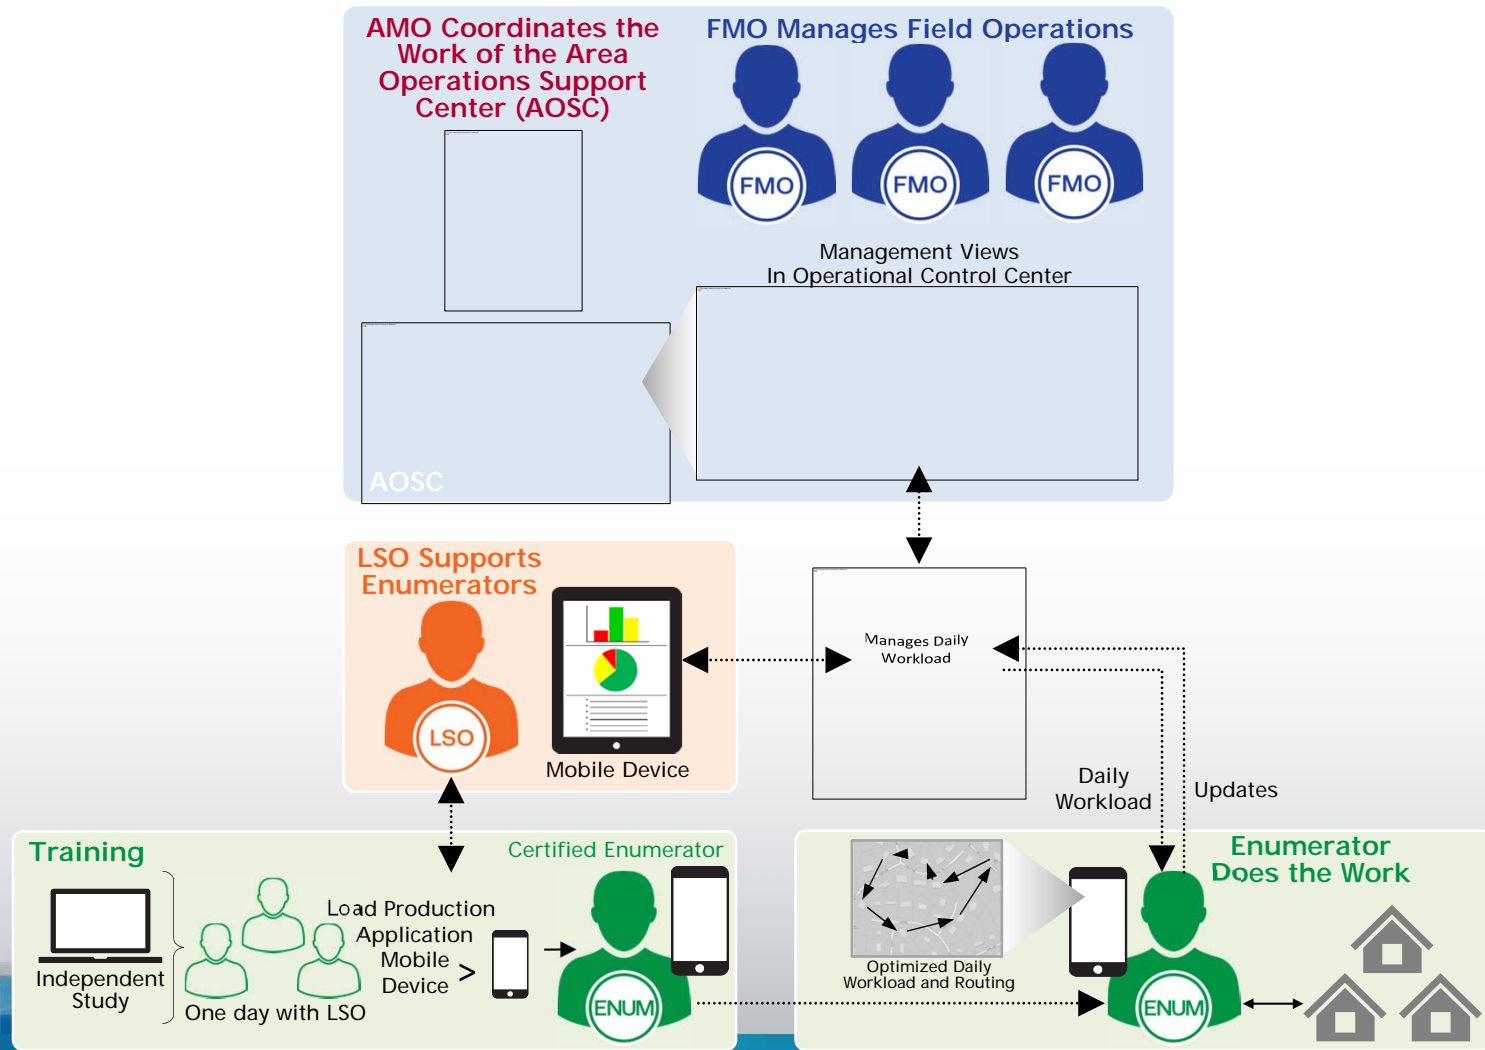

---

- Reduce NRFU workload and increase NRFU productivity with:
  - Administrative Records
  - Reduce cases that need to be resolved in NRFU by varying type of cases removed and timing of case removal from the workload
  - Reduce the number of contact attempts to cases resolved in NRFU
- Field Reengineering and Adaptive Design
  - Reduce the number of contact attempts
  - Leverage dynamic case management with route planning and other methodologies to improve enumerator productivity through automation
- Planned for an April 1 Census Day

# Field Organizational Structure

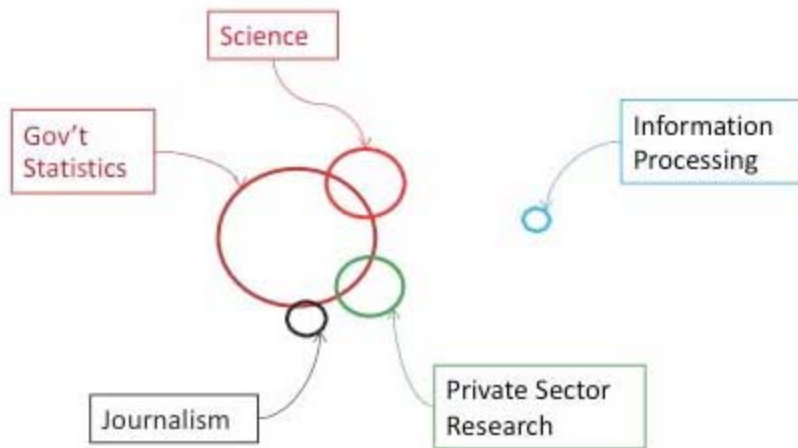

# Concept of Operations

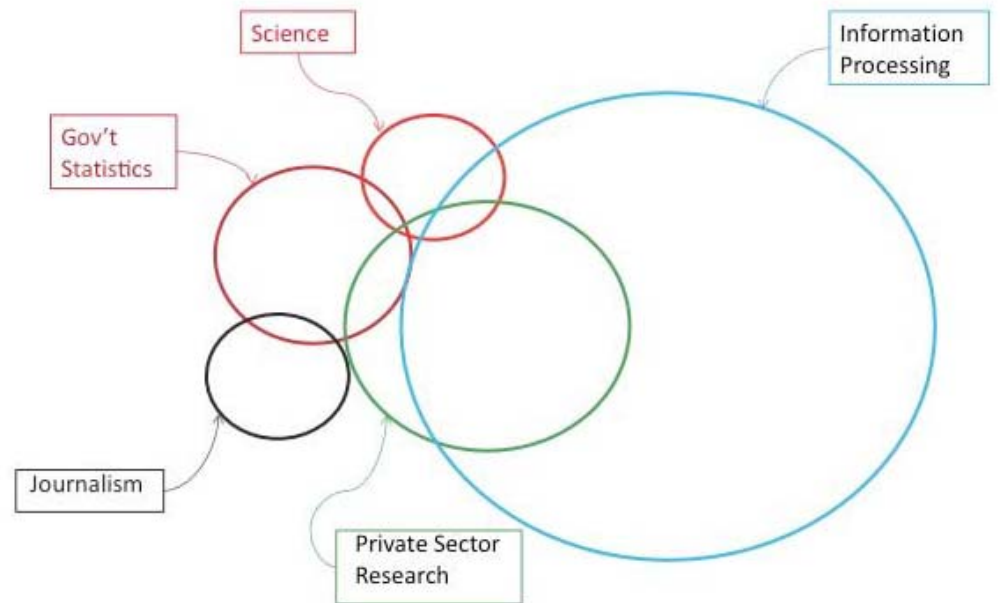

# Big Data

## Relative Sizes of Digital Data Production, c.1960

# Big Data

## Relative Sizes of Digital Data Production, 2010

# Big Data Research

---

- Administrative records to improve cost and increase timeliness and accuracy
  - Quality control
  - Coverage improvement
  - Substitute for in-person visits to households that do not self respond
- Processing techniques to allow real time decision making
  - Adaptive design
  - Self response options
- Data dissemination via API's to allow creation of apps and products that combine our data with other external data sets
  - Census explorer data visualization
  - Other apps from our web site
  - More work required in this area to stimulate interest

# Big Data: Concerns

---

- There are no currently acceptable processes or procedures for using Big Data to produce Official Statistics
  - Don't even have a common definition of Big Data

# Focus on Addresses for Survey Frames

# The GSS Initiative (GSS-I)

- An integrated program of improved address coverage, continual spatial feature updates, and enhanced quality assessment and measurement
  - All activities contribute to MAF/TIGER Database improvement
  - Builds on the accomplishments of last decade's MAF/TIGER Enhancement Program (MTEP)
- Supports the goal of a **redesigned address canvassing** for the 2020 Census
- Continual updates throughout the decade support current surveys

## Address Updates

123 Testdata Road  
Anytown, CA 94939

Lat 37 degrees, 9.6 minutes N  
Lon 119 degrees, 45.1 minutes W

## Street/Feature Updates

## Quality Measurement

# Redesigned Address Canvassing

---

## General Questions:

- Is a traditional, on-the-ground canvassing operation necessary to ensure a complete and accurate address list for the decennial census?
- Are there areas of the country in which the address list and locational information can be kept current without canvassing?
- What characteristics identify an area that should be included in a traditional canvassing?

# Research Goals

---

- Develop statistical models to identify geographic areas to be canvassed or not canvassed
  - Predict adds and deletes with estimated coverage error
- Interactive Review - Identify and classify areas
  - In which the number of addresses/housing units is stable and unlikely to change
  - With unique housing/addressing/mail delivery situations that may require canvassing
  - Land use/land cover is entirely non-residential
  - Where the address list can be updated and assured through administrative or operational methods

# Address Canvassing Research, Model, and Area Classification

---

- 2009 Statistical Model
- 2013 Statistical Model
- Interactive Review
  - 27 test counties

# MAF Error Model Objective

---

- The objective of the MEM project is to provide statistical models for the MAF that will produce estimates of coverage error at levels of geography down to the block level
  - These models could potentially inform Address Canvassing decisions

# What is the MAF Error Model?

---

- Two predictive models developed at the block level, collectively known as the “MAF Error Model”
  - One model for the number of **adds** and one model for the number of **deletes** as functions of identified predictors
- Zero-inflated (ZI) regression models
  - Zero-inflated models can provide a model-based approach to obtaining coverage estimates
    - Provides more granularity at lower levels of geography over other common modeling approaches (e.g., logistic regression)

# Address Canvassing: Master Address File (MAF) Model Validation Test and Focused Field Address Resolution Approach

---

## Model Based Approaches

- Test our ability to use statistical modeling to measure error in the MAF and to identify areas experiencing significant change
- Inform the performance of the models used to define the Address Canvassing workloads

## Focused Field Address Resolution (“micro-targeting”) Approach

- Incorporate imagery reviews to detect changes and discrepancies
- Include field updating of addresses for portions of blocks

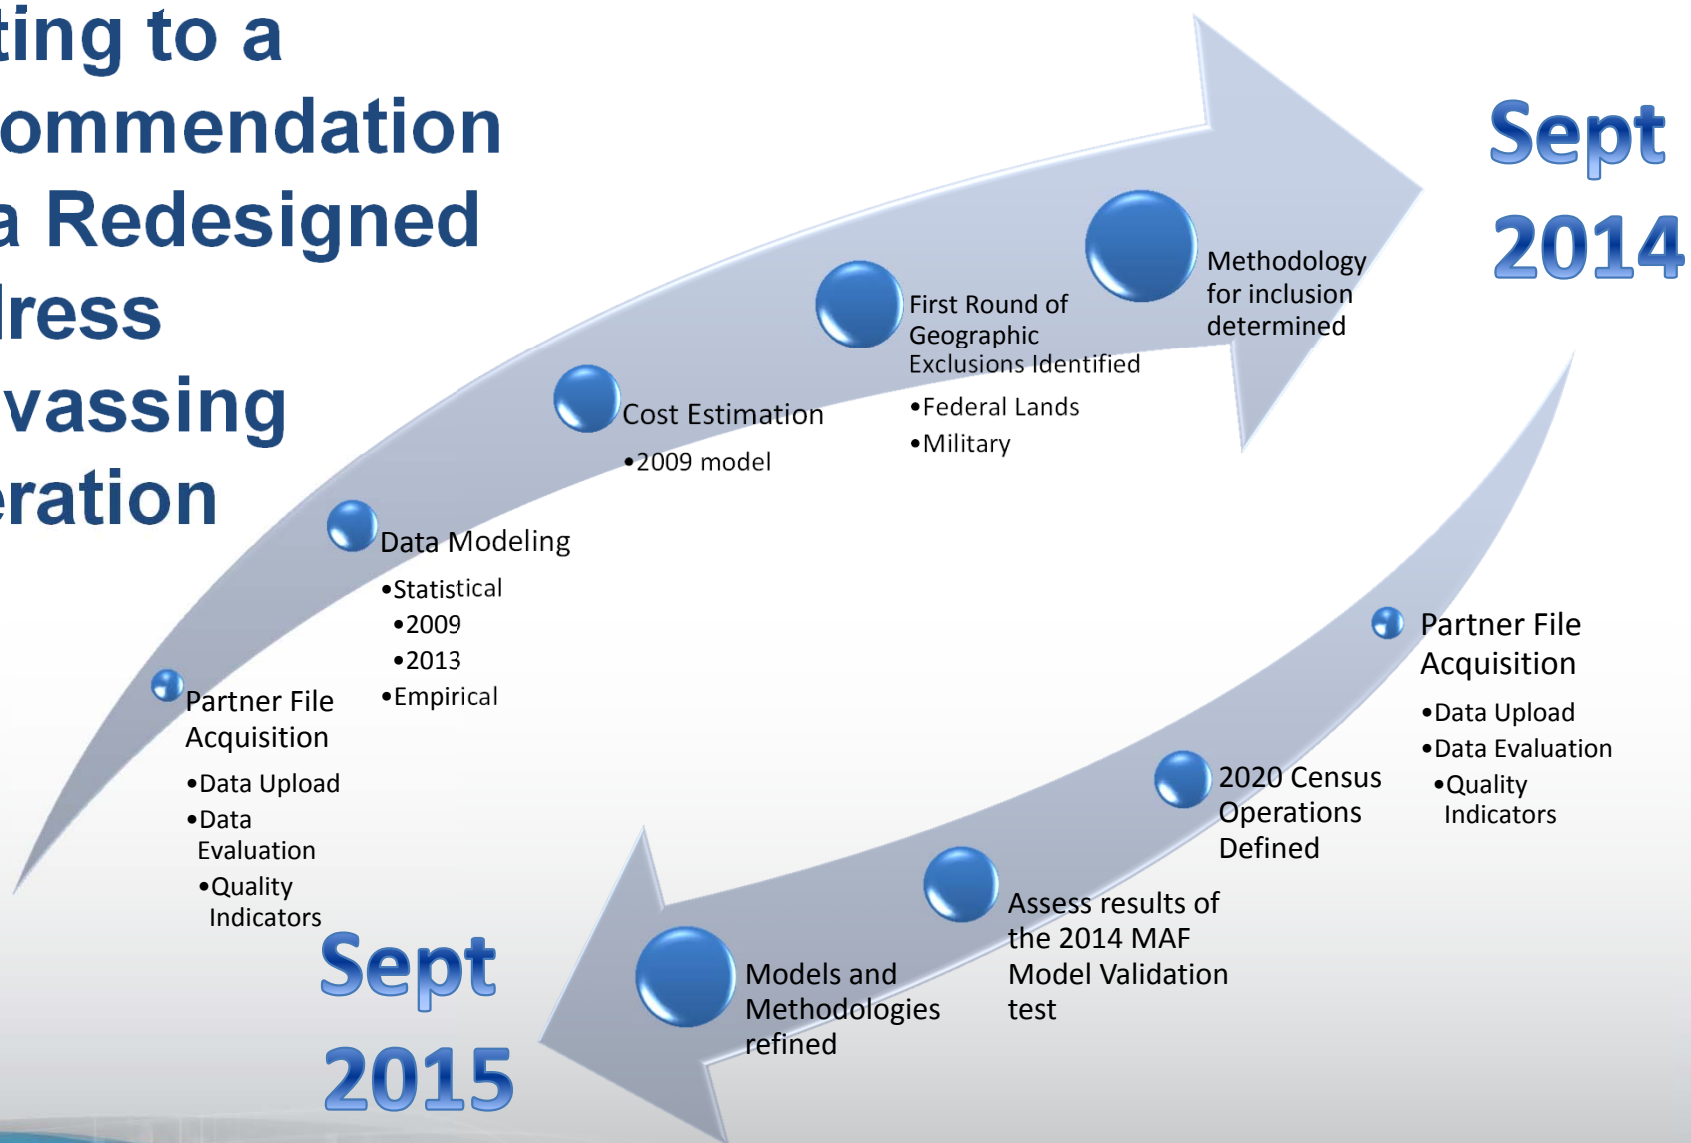

# MAF Model Validation Test Objectives

---

- The purpose of the MAF Model Validation Test (MMVT) is to collect data to inform components of the Address Canvassing decision-points
  - MAF Error Model
  - Address Canvassing, Research, Model, and Classification team
  - Models for Zero Living Quarters blocks
- Test the concept of Micro-Targeting and uses of imagery

# Getting to a Recommendation for a Redesigned Address Canvassing Operation

# Address Canvassing Methodology Plan

- Preliminary Federal Land Use and similar types of blocks
- 2009 TEA\* Operational Overlay - Remove non-MO/MB areas (UL, UE...)
- 2009 Statistical Models (2020 and GSS) - Use only data available in 2009

- Preliminary Cost Estimation
- Jan 2014 - March 2014

- Federal Land Use and 2009 TEA Operational Overlay
- Preliminary Interactive Review 4/14  
Use Aerial Imagery to add/remove blocks
- 2013 Statistical Models 4/14  
Use only data available in 2013

- Cost Estimation
- Quality Metrics (MMVT)
- LCAT

*Process definition occurs here and will be repeated*

**GEO "go/no go" Recommendation 9/14**  
**Field Infra Decision Point 1/15**

*LCAT will examine costs on later operations and provide feedback to modify models*

- MAF Model Validation Test 9/14-12/14  
Data available on January 2015

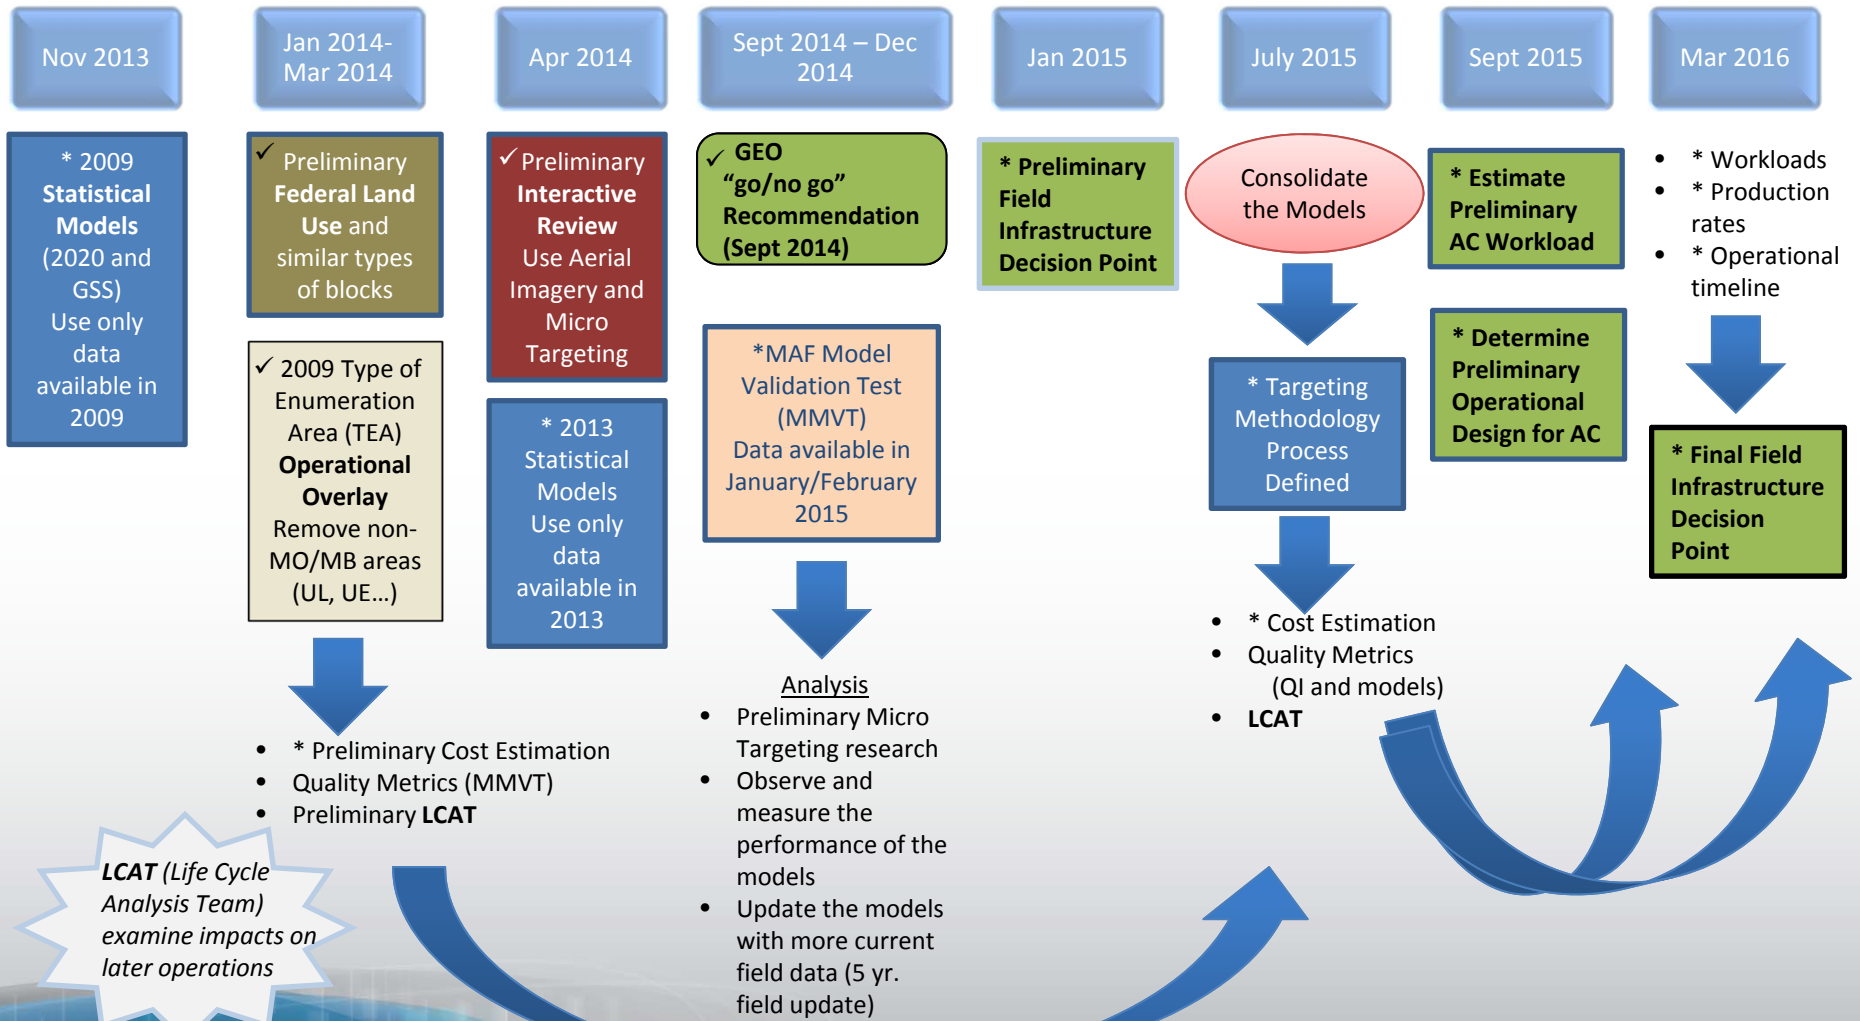

- Observe and measure the performance of the models
- Update the models with more current field data (5 yr. field update)

- Consolidate the Models
- 2015 Methodology 3/15  
Process Defined

- Cost Estimation
- Quality Metrics (QI and models)
- LCAT

**- Recommendation for Integration 9/15**  
**- Field Infrastructure Decision Point 1/16**

# Frame Schedule

# Summary

---

- A redesigned census
- Traditional approaches are challenged
- Adds risk
- Modernization is critical
- All comes down to cost

# Questions?

---
