## Port Information: Maritime ITS <-> Marine Geospatial Information

*Example - Port of Oslo, Norway*

An initiative to establish a national port information system with reference to S-131 Marine Harbour Infrastructure

12

## Digital routes for navigators

From [routeinfo.no](http://routeinfo.no) you can download over 600 digital reference routes for navigation to all major Norwegian ports – to support route planning. The service also gives important information for safe, efficient and sustainable route planning.

Download reference routes (RTZ) directly to the ECDIS/ navigation display on board

## MAIN FINDINGS FROM THE FRAM-ANALYSIS

To get and provide rough estimates of the benefit of the potential risk reduction associated with introducing quality assured sailing routes for the Norwegian coast, through routeinfo.no, we have conducted two analyses using FRAM. FRAM is the Norwegian coastal administration's model to calculate costs and benefits at sea. First, we perform an analysis where we **reduce the probability of grounding by 1 percent**, thereafter we perform another analysis where we reduce the probability for collision by 1 percent. The results are thereafter analyzed in a cost-benefit framework and a net present value over ten years is calculated.

Routeinfo.no is primarily used by ships above 70 meters. Additionally, the accident data we have used to evaluate the risk reductions only cover accidents concerning such ships. The analysis restricts itself to **benefits for ship of length above 70 meters**.

The results are highly uncertain and do not take other costs or benefits into consideration. They do, however, **illustrate the possible benefits** the quality assured routes provided by the Norwegian Coastal Administration through Routeinfo.no, could deliver through improved maritime safety.

Given our assumptions, our rough estimates of the net present value of the benefit of reduced risk of grounding over the forthcoming ten year period amounts to 37 MNOK. The equivalent figure is 8 MNOK for collisions, but this estimate is more uncertain and must be interpreted as an upper bound. In total the potential benefit adds up to 45 MNOK.

**The benefit of improved maritime safety**  
(net present value over 10 years)

Grounding:

**NOK 37 million**

Collision:

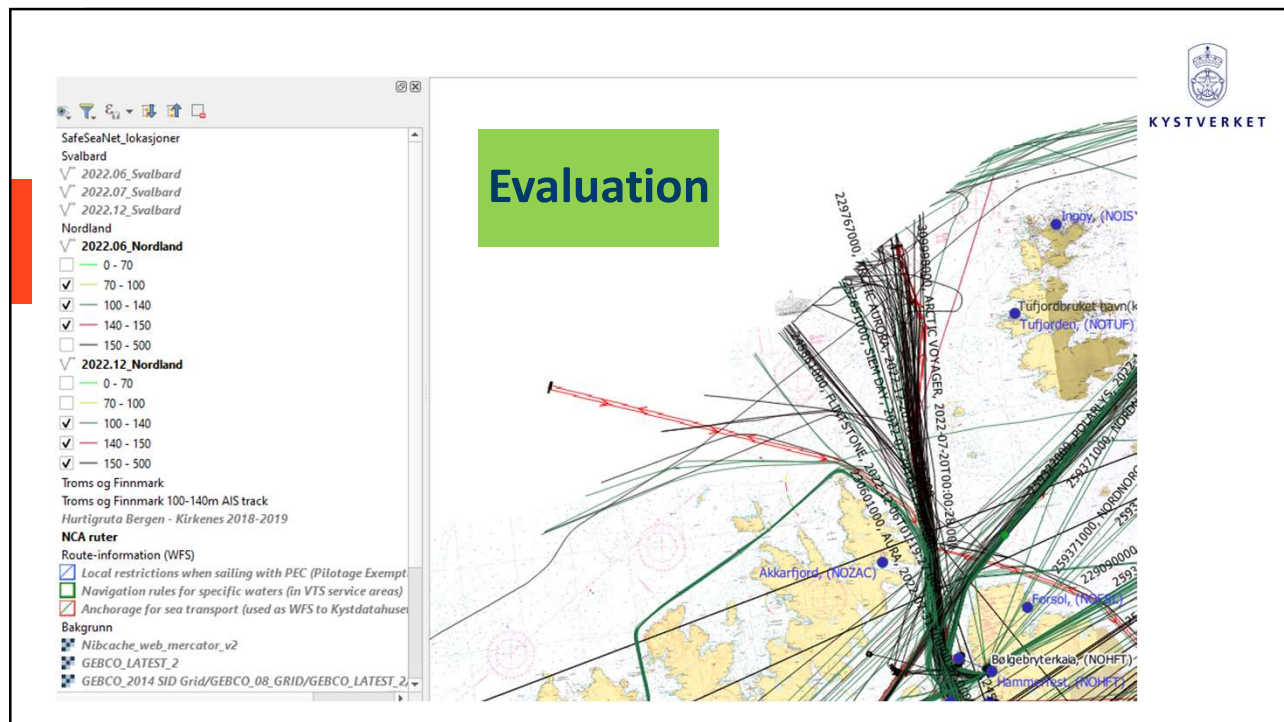

**Up to NOK 8 million**

Joint potential benefit:

**NOK 45 million**

It is important to note that the benefits above does not take incurred costs of implementation of routeinfo.no. Thus, the report simply shows the potential benefits of routeinfo.no with regards to maritime safety.
