

Sustaining the Global Geodesy Supply Chain

Achieving Resilience

Fernand Bale
Co-Chair, UN-GGIM Subcommittee on Geodesy

*The canvas is an important element that allows the painter to create a masterpiece that lasts over time and gains value.
In my opinion, this is what geodesy is for geospatial information*

A satellite with large solar panels is shown in space, orbiting the Earth. The Earth's surface is visible, showing continents and clouds. The satellite is positioned in the upper left quadrant of the frame, with its solar panels extending towards the center. The Earth is on the right side, showing a curved horizon. The background is black with some stars.

Geodesy is the science of measuring the Earth's shape, orientation, and gravity field.

Geodesy is providing positioning, timing and navigation services.

Imagine this scenario...
